# HYDRAULIC SHOCK ABSORBER BUFFER

**Softly  
Safety  
Smoothly**

**KOBA Co.,Ltd**

**KOBA**  
BEST SHOCK ABSORBER

**Flexibility**  
**Versatility**  
**Innovative Solutions**

## OVERVIEW

Established in 1993, KOBA has developed ability by continuous R & D and quality enhancement under the value of Change and Innovation by 'KOBA' brand.

We supply various solutions regarding Shock and Vibration on the basis of accumulated & state-of-art technology and abundant experiences for a long time.

And also by continuous R & D and Quality Assurance System, we design, manufacture, and assure quality of Shock Absorber, Hydraulic Buffer, Visco Elastic Buffer, Hydro Check, Rate Control, Gas Spring, Special Damper, etc., then supply all of the world as well as domestic market.

In addition to standard products, we are giving various solutions for order made products also and react against fast delivery requirement with best quality. And by endless research and development we commercialize our Intellectual Property Rights.

As a leader of Shock Absorber, we promise to give trust, satisfaction and optimal customized service that customer needs on the basis of differentiated technology, accumulated knowhow, and effective management system. And as we are in rapidly changing global era, we will be the company that grow and evolve with customer with the target of "Quality First"

# Shock Absorbers & Buffers

## // Shock Absorbers & Buffers

### KMA Series

KMA Series is a mini and adjustable product, and is adjustable to control damping force according to impact velocity by 12 steps from 0° to 300°. By using bumper head it solves fundamentally piston shooting problem (so called bottom-out problem) at piston end, so stop collar is not needed. The Energy absorbing capacity is increased by increasing of cylinder's sectional area and the range of effective weight is widened.

### KMS Series

KMS Series is a self compensating type and because of variable orifice impact object can be gradually and smoothly stopped. By using bumper head it solves fundamentally piston shooting problem(so called bottom-out problem) at piston end, so stop collar is not needed. The energy absorbing capacity is increased by increasing of cylinder's sectional area and the range of effective weight is widened.

### KSA Series

KSA Series is medium and large size and the specific adjustment is possible by 12 steps' adjustment dial at front and end. And at front side, the function of adjustment stop collar is included.

### KHA Series

KHA Series a medium and large size and the specific adjustment of 8 steps is possible according to impact velocity by adjusting adjustment dial at the center of body from 0 to 180°.

### KHG Series

For heavy duty application, KHG Series is a self compensating type and absorbs big impact energy by interaction of inner oil and nitrogen gas. And piston rod is returned by the compressed nitrogen gas.

### KHS Series

For heavy duty application, KHS Series is a self compensating and large capacity type and collision is smoothly stopped by high damping force because of optimized orifice structure design according to user's required using condition.

### KCSC Series

KCSC Series has similar structure of KHG Series and is gas return type. Peak value is low because gas volume ratio is bigger than oil volume ratio.

### KES Series

KES Series is developed by using damping force and spring force of Visco-Elastic Fluids, and structure is simple and robust but has big damping constant comparing to its small appearance.

### KRC Series

KRC Series is a product which speed control of transfer equipment is possible by tension and compression to both and one direction. It controls softly and safely the machine operation.

### KHC Series (Hydro Check)

Hydro Check Series enables precise speed and location control for the moving equipments with various strokes

### KG, KGP Series (Gas Spring)

KG and KGP Series are used in various range of industries because those have several merits such as speed control function on small spring constant and extension & compression of long stroke, and those make stable force comparing to general Plate spring or coil spring. Various gas springs according to stroke, speed force, mount type, etc are customized under consideration of usage and installation environments.

### KGL Series (Free Lock Gas Spring)

KGL Series has all merits of general gas spring it also has free lock function to operators and they can decide a stroke at wanted location where operators want to install.

# Hydraulic Shock Absorbers

## // Hydraulic Shock Absorbers

Global business circumstances needs bigger production capacity with high speed. On the contrary, by industrial acceleration impact mass is become heavy and vibration makes tough working conditions, and fatigue energy accumulated on the production facilities. Without proper machines can be damaged easily.

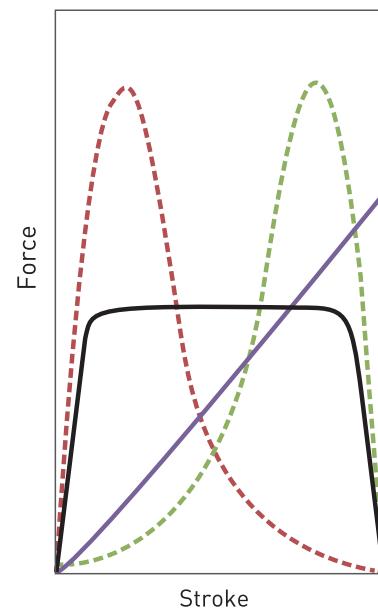

KOBA supplies exceptionally enhanced various products by developing innovative Shock Absorbers by continuous R & D. And also KOBA developed products are optimized general industrial areas which are suffered by shock and vibration. Sophisticated KOBA Products' life cycle has been prolonged by enhanced durability, the range of effective mass is widened, and the energy absorption capacity is doubled when it comparing with previous model.

You can compare with other impact absorption products like Shock Absorber are Rubber, Spring, and Hydraulic / Pneumatic Devices.

Shock absorption features are as below.

### Shock absorption comparison chart

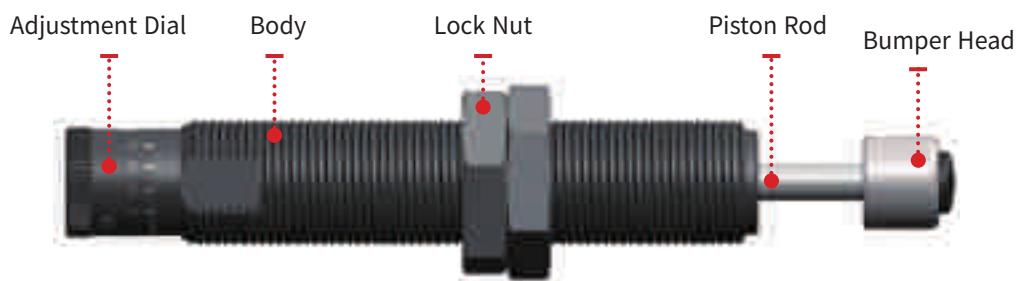

Rubber & Spring	When decelerating moving object by rubber or spring, the compressed force is not constant and the resistance force is increased gradually, due to that characteristics, impact energy is not absorbed and rather stored, and it transfers impact energy with less absorption to the object.
Hydraulic & Pneumatic Devices	At deceleration moment, single orifice devices like hydraulic cylinder, dashpot, deceleration valve, etc produce big resistance force in initial stage. Rather if pneumatic device is used, gradually the resistance force is increased and maximum the force become biggest at the end of stroke.
KOBA Shock Absorbers	KOBA Shock Absorbers absorb impact energy at constant resistance through all the stroke sections by using multiple orifices to minimize the impact force when moving object is stopped. Thus, KOBA shock absorber can stop moving object softly by minimized impact force.

- Shock Absorber
- - - Hydraulic Device
- - - Pneumatic Device
- Spring / Rubber

## // Shock Absorber's Overview Structure and Function

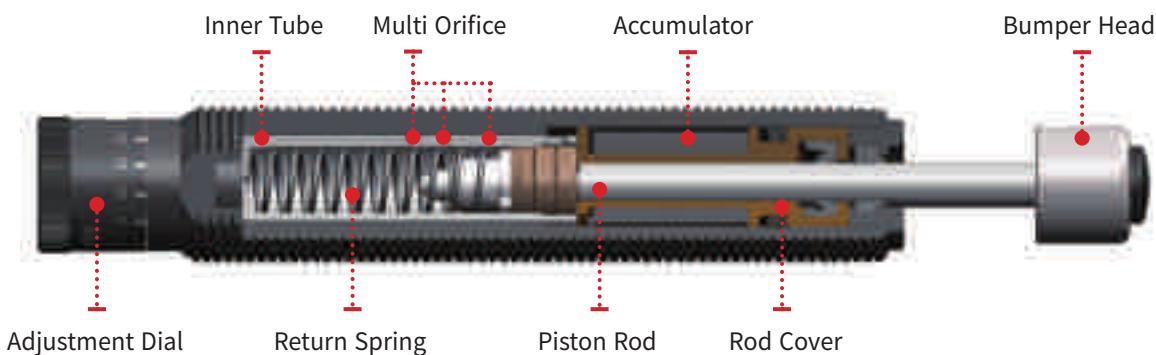

1. Shock Absorber consists of body, bumper head, piston rod, adjustment dial, and lock nut.
2. Thanks to full threaded body it is easy to be installed and precise location fixing is possible. And surface area is increased to dissipate thermal energy fast to atmosphere.
3. Bumper head has a role of stopper.
4. Piston rod transfers the Impact energy of bumper head to piston.
5. Adjustment dial is useful that damping force can be adjusted to impact weight and velocity according to damping conditions.
6. Lock nut is useful for installing and fixing shock absorber tightly with body tread installation.

## // Shock Absorber's Inner view Structure and Working principle

Inside of shock absorber consists of piston, check valve, accumulator, Inner tube, multiple orifice, return spring, oil, etc.

On impacting, the piston rod is inserted into Inner tube and check valve is closed. And it forces oil in the chamber to flow through orifices. At the same time, damping force is generated into piston. Compressed oil which flowed into accumulator is compensating same volume of piston inside. Return process is made by return spring and check valve is opened then piston rod is returned to its original position.

## // Principal of Energy Absorption

After impacting, compressed oil by piston is to be forced out of Inner tube through orifices. The impact energy is changed into thermal energy then dissipated to atmosphere through threaded body.

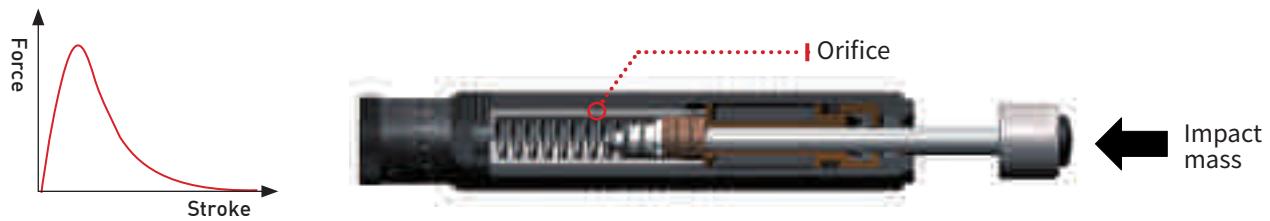

# Hydraulic Shock Absorbers

## // Orifice Feature

### 1. Adjustable

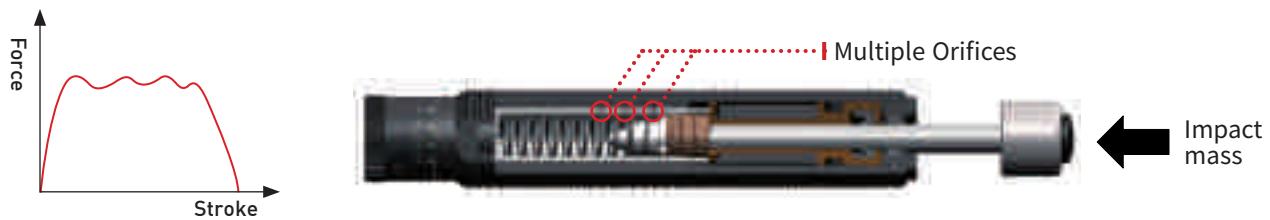

#### 1) Single Orifice

Single Orifice Type has a dashpot structure with gap between piston and Inner tube or one hole. resistance characteristic is shown as below. Orifice area is same on entire stroke section, so resistance force is increased immediately after collision. And as stroke progress, the speed decreases and resistance force minimized at the end.

#### 2) Multiple Orifices

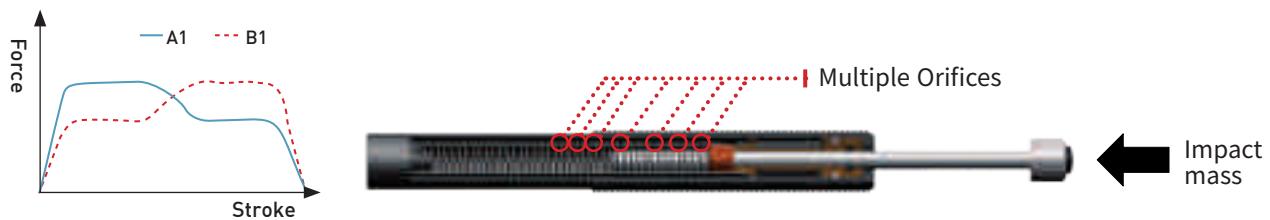

By using multiple orifices, total oil route dimension is decreasing when the stroke is on-going. It enables to maintain total shock absorption safely and softly. Adjustment dial can provide best deceleration features against various collision cases.

### 2. Self compensating

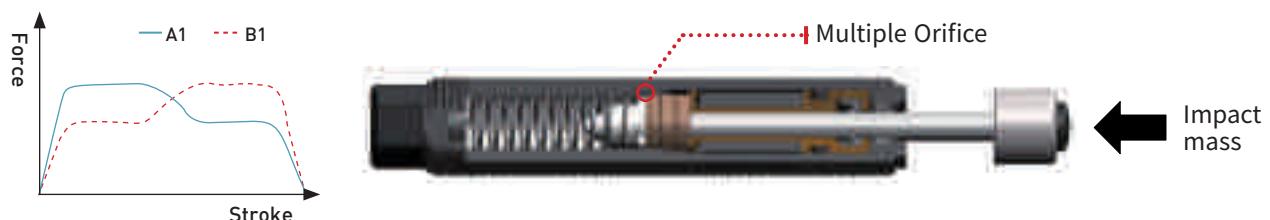

#### 1) Multiple Orifices

Operation principal is same of adjustable type. When it set to the optimized orifices' area is applied, adjustment is not possible after that. Diagram a1 shows high velocity - light impact mass, b1 shows low velocity-heavy impact mass.

#### 2) Metering Orifice

It is self compensating type. It has quick response and better efficiency for short stroke because the changing of orifice area is continuous. Products of below Stroke 25mm are classified as this type(Except KMS 14-20).

# // Shock Absorber Model Selection

## 1. 5 conditions for Model Selection

- 1) Load Weight      2) Impact Velocity      3) Propelling Force      4) Cycle/hour
- 5) Work Environment

## 2. Model Selection Steps

### 1) Check working conditions

- ⇒ Check movement direction : Vertical Motion, Horizontal Motion, Rotary Motion, with or without Propelling force
- ⇒ Check Maximum weight
- ⇒ Check moving load velocity V(m/s) : In case of cylinder power generated movement condition, consider the velocity as twice of original impact speed.

### 2) Calculate the Kinetic Energy

Calculate the Kinetic Energy [  $E_K = (m \times V^2) / 2$  ]

### 3) Check Propelling Force

If propelling force exist, please refer the model selection of calculation formula propelling force (symbol explanation) selection formula. After calculating propelling force, select shock absorber's temporary model.

### 4) Temporary Stroke selection of Shock Absorber

According to shock absorber's temporary model, select temporary stroke.

### 5) Calculation of Propelling Force Energy

Find propelling energy with the reference of formulae described in catalog. [  $E_W = F \times S$  ]

### 6) Find Total Energy and Select a model of Shock Absorber

Calculate total energy [  $E_T = E_K + E_W$  ]

### 7) Check the absorption Energy

Find energy/hour from using cycle and energy/cycle, and check the value is in the range of usable specification in the engineering data of catalogue.

$$[ E_{TC} \geq E_T \times C ]$$

### 8) Check the Effective Mass

In case of propelling force, effective weight must be checked, especially if the velocity is below 0.3m/s (low velocity).

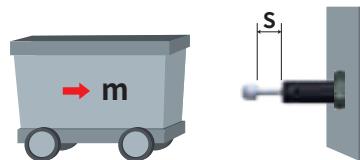

$$m_e = (2 \times E_T) / V^2 \quad [ \text{Calculated } m_e \text{ should be in the range of catalogue engineering data} ]$$

In case of no propelling force,  $m_e = m$  (Weight of Impact item)

Even if the moving load is in same weight and velocity, the effective mass could be different depending on the propelling force and initial location of shock absorber.

# Hydraulic Shock Absorbers

**(A) Without Propelling Force**

$m=50\text{kg}$   
 $E_k=100\text{Nm}$   
 $E_T=100\text{Nm}$

$V=2\text{m/s}$   
 $E_w=0$   
 $m_e=50\text{kg}$

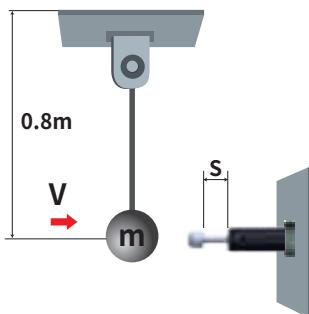

**(B) With Propelling Force**

$m=50\text{kg}$   
 $E_k=100\text{Nm}$   
 $\text{Pressure}=5\text{bar}$   
 $E_T=351.2\text{Nm}$

$V=2\text{m/s}$   
 $\text{Cylinder Bore}=80\text{mm}$   
 $F=2512\text{N}$   
 $m_e=175.6\text{kg}$

**(C) Without Propelling Force**

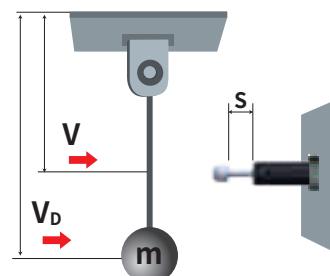

$m=20\text{kg}$   
 $E_w=0\text{Nm}$

$V=2\text{m/s}$   
 $E_T=40\text{Nm}$

$E_k=40\text{Nm}$   
 $m_e=20\text{kg}$

**(D) With Propelling Force**

$m=20\text{kg}$   
 $V_D=1.25\text{m/s}$   
 $E_T=71.36\text{Nm}$

$V=2\text{m/s}$   
 $E_k=40\text{Nm}$   
 $m_e=91.34\text{kg}$

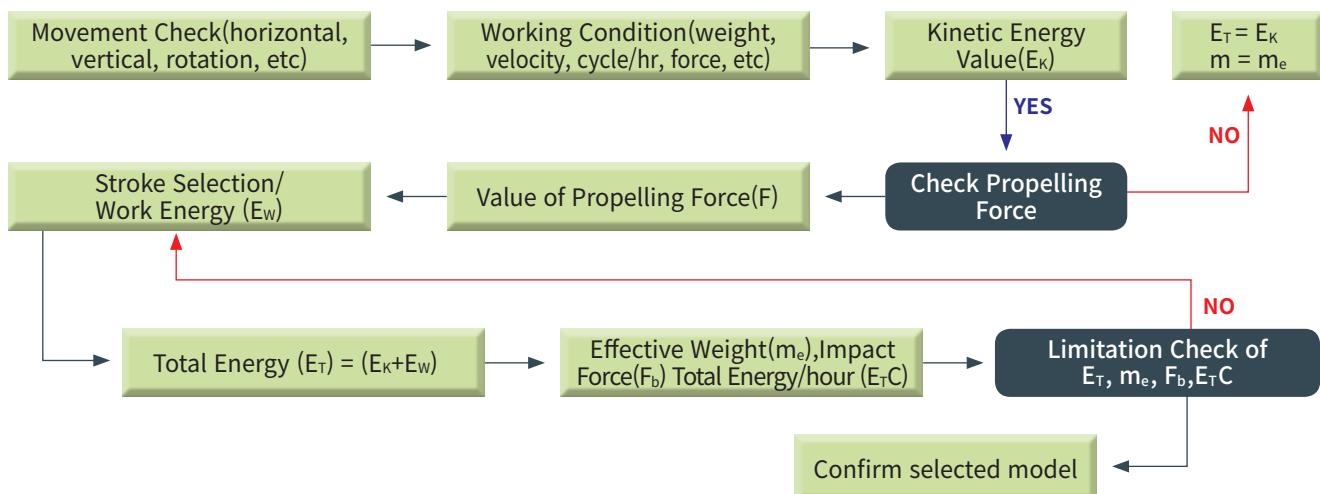

## 9) Check operation temperature

- ⇒ Standard operation temperature within range of : -10~80°C
- ⇒ For Specific or different temperature, please consult us.

## 10) Remark

Please check our website, [www.kobapage.com](http://www.kobapage.com) for easy model selection or contact us for easy engineering solution.

### Flow chart of Model selection

## // Model Selection Calculation Formula

### ⌚ Symbol Explanation

Symbol	Unit	Explanation
$E_k$	Nm	Kinetic Energy
$E_w$	Nm	Work Energy(Propelling Energy)
$E_t$	Nm	Total Energy
$E_{tC}$	Nm/h	Total Energy/hour
$F_s$	N	Shock Absorber Force
$F$	N	Propelling Force
$m_e$	kg	Effective Mass
$S$	mm	Stroke
$C$	Cycle/h	Impact Cycle/hour
$V$	m/s	Impact Speed
$V_e$	m/s	Actual Impact Speed
$P$	kW	Motor Power

Symbol	Unit	Explanation
$d$	mm	Cylinder Rod Diameter
$D$	mm	Cylinder Bore
$g$	$m/s^2$	Acceleration of Gravity
$T$	Nm	Propelling Torque
$H$	m	Fall Height
$m$	kg	Weight
$p$	bar	Working Pressure of Cylinder
$\omega$	rad/s	Angular Velocity
$\alpha$	° (degree)	Incline Angle
$I$	$Nm/s^2$	Inertia Moment
$\mu$	$\mu$	Friction Coefficient
$a$	$m/s^2$	Acceleration / Deceleration

✓ 1kgf = 9.81N , 1Nm = 1J , 1MPa = 10bar = 10.2kg/cm<sup>2</sup> , 1g = 9.8m/s<sup>2</sup>

## // Hydraulic Shock Absorbers

### ⌚ Symbol Explanation

Description		Formula
Kinetic Energy( $E_k$ )	General Inertial Moving	$E_k = (m \times V^2) / 2$
	Vertical Free Falling	$E_k = m \times g \times H$
	Work Energy ( $E_w$ )	$E_w = F \times S$
	Total Energy ( $E_t$ )	$E_t = E_k + E_w$
	Total Energy/hour ( $E_{tC}$ )	$E_{tC} = E_t \times C$
	Max. Shock Absorber Force ( $F_s$ ) (Required for checking the hardness of installation part)	$F_s = E_t / (S \times 0.8)$
	Motor Power Propelling Force	$F = (3000 \times kW) / V$
	Cylinder Force (Horizontal Tension)	$F = 0.0785 \times D^2 \times P$
	Cylinder Force (Horizontal Compression)	$F = 0.0785 \times (D^2 - d^2) \times P$
	Cylinder Force(Vertical) ( $F_1$ : Cylinder Propelling Force)	$F = F_1 + (m \times g)$
Propelling Force ( $F$ )	Vertical Down	$F = F_1 - (m \times g)$
	Vertical Up	$F = m \times g$
	Vertical Free Fall	$F = m \times g$
	Friction force of Horizontal Moving Conveyor Belt (Apply general friction Coefficient 0.1~0.2)	$F = m \times g \times \mu$
	Effective Mass ( $m_e$ )	$m_e = (2 \times E_t) / V^2$ (In case of Horizontal Movement $m_e = m$ )
	Free Fall	$V = \sqrt{2 \times g \times H}$
	Acceleration (ex: Pneumatic Cylinder)	$V = \frac{2D}{t}$ (D=Distance)
	No Acceleration(Hydraulic Cylinder, Motor)	$V = \frac{D}{t}$ (D=Distance)
	Deceleration (a)	$a = V^2 / (2 \times S)$
	Stopping Time (t)	$t = \frac{2 \times S}{0.8 \times V}$

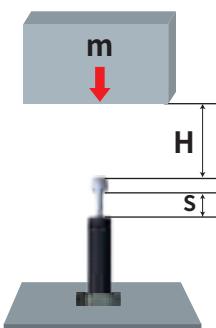

✓ 1kgf = 9.81N , 1Nm = 1J , 1MPa = 10bar = 10.2kg/cm<sup>2</sup> , 1g = 9.8m/s<sup>2</sup>

# KOBA Shock Absorber's Movement

## KOBA Shock Absorber's Movement

### A. Vertical Movement(Free Fall)

- Weight  $m=1200\text{kg}$
- Free Fall Height  $H=0.5\text{m}$
- Impact Cycle  $C=250/\text{h}$

$$E_K = m \cdot g \cdot H = 1200 \times 9.8 \times 0.5 = 5880 \text{Nm}$$

Model Temporary : KHA 115 – 150 (Stroke: 150)

$$E_W = m \cdot g \cdot S = 1200 \times 9.8 \times 0.15 = 1765 \text{Nm}$$

$$E_T = E_K + E_W = 5880 + 1765 = 7645 \text{Nm}$$

$$E_{TC} = E_T \cdot C = 7645 \times 250 = 1911250 \text{Nm/h}$$

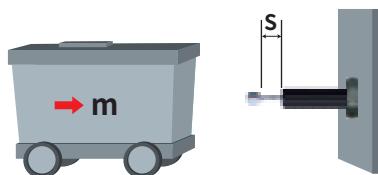

$$V = \sqrt{2 \cdot g \cdot H} = \sqrt{2 \times 9.8 \times 0.5} = 3.1 \text{m/sec}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 7645}{3.1^2} = 1591 \text{kg}$$

Model : KHA 115 – 150

### B. Horizontal Movement(Without Propelling Force)

- Weight  $m=500\text{kg}$
- Impact Cycle  $C=200/\text{h}$
- Impact Velocity  $V=1.5\text{m/s}$

$$E_K = \frac{m \cdot V^2}{2} = \frac{500 \times 1.5^2}{2} = 562.5 \text{Nm}$$

Model Temporary : KHA 42-75 (Stroke: 75)

$$E_W = 0$$

$$E_T = E_K + E_W = 562.5 + 0 = 562.5 \text{Nm}$$

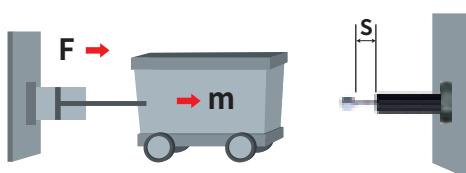

$$E_{TC} = E_T \cdot C = 562.5 \times 200 = 112500 \text{Nm/hr}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 562.5}{1.5^2} = 500 \text{kg}$$

Model : KHA 42 – 75

### C. Horizontal Movement(With Propelling Force)

- Weight  $m=800\text{kg}$
- Working Pressure  $P=5\text{bar}$
- Impact Velocity  $V=1.8\text{m/s}$
- Impact Cycle  $C=200/\text{h}$
- Cylinder Bore  $d=80\text{mm}$

$$E_K = \frac{m \cdot V^2}{2} = \frac{800 \times 1.8^2}{2} = 1296 \text{Nm}$$

$$F = 0.0785 \cdot d^2 \cdot P = 0.0785 \times 80^2 \times 5 = 2512 \text{N}$$

Model Temporary : KHA 64 – 100 (Stroke: 100)

$$E_W = F \cdot S = 2512 \times 0.1 = 251.2 \text{Nm}$$

$$E_T = E_K + E_W = 1296 + 251.2 = 1547.2 \text{Nm}$$

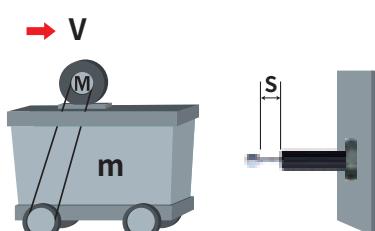

$$E_{TC} = E_T \cdot C = 1547.2 \times 200 = 309440 \text{Nm/h}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 1547.2}{1.8^2} = 955.1 \text{kg}$$

Model : KHA 64 – 100 or KHA 85 – 50

### D. Horizontal Movement(With Motor's Propelling Force)

- Weight  $m=1200\text{kg}$
- Impact Velocity  $V=1.6\text{m/s}$
- Motor Output  $P=1\text{kW}$
- Impact Cycle  $C=130/\text{h}$

$$E_K = \frac{m \cdot V^2}{2} = \frac{1200 \times 1.6^2}{2} = 1536 \text{Nm}$$

$$F = \frac{3000 \cdot P}{V} = \frac{3000 \times 1}{1.6} = 1875 \text{N}$$

Model Temporary : KHA 64 - 100 (Stroke: 100)

$$E_W = F \cdot S = 1875 \times 0.1 = 187.5 \text{Nm}$$

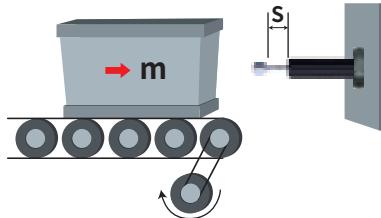

$$E_T = E_K + E_W = 1536 + 187.5 = 1723.5 \text{Nm}$$

$$E_{TC} = E_T \cdot C = 1723.5 \times 130 = 224055 \text{Nm/h}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 1723.5}{1.6^2} = 1346.5 \text{kg}$$

Model: KHA 64 - 100 or KHA 85 – 50

### E. Horizontal Movement(Driven Roller Free-Flow System)

- Weight  $m=50\text{kg}$
- Impact Velocity  $V=1.5\text{m/s}$
- Friction Coefficient  $\mu=0.3$
- Impact Cycle  $C=100/\text{h}$

$$E_K = \frac{m \cdot V^2}{2} = \frac{50 \times 1.5^2}{2} = 56.3\text{Nm}$$

$$F = m \cdot g \cdot \mu = 50 \times 9.8 \times 0.3 = 147\text{N}$$

Model Temporary : KMA 25 – 25(Stroke: 25)

$$E_W = F \cdot S = 147 \times 0.025 = 3.7\text{Nm}$$

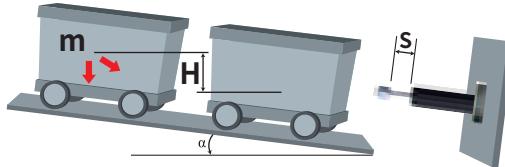

$$E_T = E_K + E_W = 56.3 + 3.7 = 60\text{Nm}$$

$$E_{TC} = E_T \cdot C = 60 \times 100 = 6000\text{Nm/h}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 60}{1.5^2} = 53.3\text{kg}$$

Model: KMA 25 – 25

### F. Free Fall according to incline

- Weight  $m=60\text{kg}$
- Free Fall Height  $H=0.3\text{m}$
- Inclination Angle  $\alpha=25$
- Impact Cycle  $C=200/\text{h}$

$$E_K = m \cdot g \cdot H = 60 \times 9.8 \times 0.3 = 176.4\text{Nm}$$

$$F = m \cdot g \cdot \sin\alpha = 60 \times 9.8 \times 0.42 = 247\text{N}$$

Model Temporary : KMA 36 – 50(Stroke: 50)

$$E_W = F \cdot S = 247 \times 0.05 = 12.4\text{Nm}$$

$$E_T = E_K + E_W = 176.4 + 12.4 = 188.8\text{Nm}$$

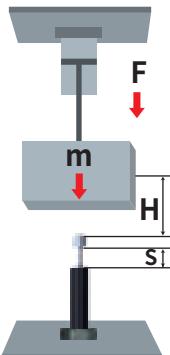

$$E_{TC} = E_T \cdot C = 188.8 \times 200 = 37760\text{Nm/h}$$

$$V = \sqrt{2 \cdot g \cdot H} = \sqrt{2 \times 9.8 \times 0.3} = 2.4\text{m/s}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 188.8}{2.4^2} = 65.6\text{kg}$$

Model: KMA 36 – 50 or KHA 42 – 25

### G. Vertical Movement (With Propelling Force)

- Weight  $m=500\text{kg}$
- Cylinder Bore  $d=100\text{mm}$
- Working Pressure  $P=5\text{bar}$
- Impact Velocity  $V=1\text{m/s}$
- Impact Cycle  $C=250/\text{h}$

$$E_K = \frac{m \cdot V^2}{2} = \frac{500 \times 1^2}{2} = 250\text{Nm}$$

$$F = 0.0785 \cdot d^2 \cdot P + m \cdot g$$

$$= 0.0785 \times 100^2 \times 5 + 500 \times 9.8 = 8825\text{N}$$

Model Temporary : KHA 64 – 50 (Stroke: 50)

$$E_W = F \cdot S = 8825 \times 0.05 = 441.3\text{Nm}$$

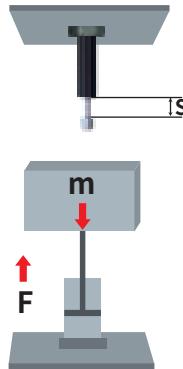

$$E_T = E_K + E_W = 250 + 441.3 = 691.3\text{Nm}$$

$$E_{TC} = E_T \cdot C = 691.3 \times 250 = 172825\text{Nm/h}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 691.3}{1^2} = 1382.6\text{kg}$$

Model: KHA 64 – 50

### H. Vertical Movement (With Propelling Force)

- Weight  $m=100\text{kg}$
- Cylinder Bore  $d=125\text{mm}$
- Working Pressure  $P=5\text{bar}$
- Impact Velocity  $V=1.6\text{m/s}$
- Impact Cycle  $C=200/\text{h}$

$$E_K = \frac{m \cdot V^2}{2} = \frac{100 \times 1.6^2}{2} = 128\text{Nm}$$

$$F = 0.0785 \cdot d^2 \cdot P - m \cdot g$$

$$= 0.0785 \times 125^2 \times 5 - 100 \times 9.8 = 5152.8\text{N}$$

Model Temporary : KHA 42 – 50(Stroke: 50)

$$E_W = F \cdot S = 5152.8 \times 0.05 = 257.6\text{Nm}$$

$$E_T = E_K + E_W = 128 + 257.6 = 385.6\text{Nm}$$

$$E_{TC} = E_T \cdot C = 385.6 \times 200 = 77120\text{Nm/h}$$

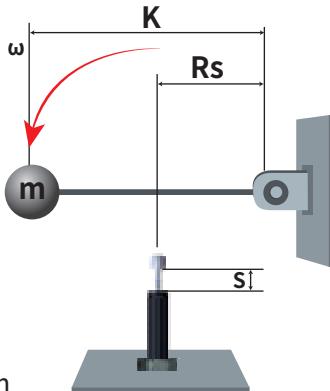

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 385.6}{1.6^2} = 301.25\text{kg}$$

Model: KHA 42 – 50

# KOBA Shock Absorber's Movement

## I. Swiveling Mass Without Propelling Force

- Weight  $m=500\text{kg}$
- Mass Velocity  $V_m=2\text{m/s}$  (From Mass Center)
- Rotation Radius  $K=0.8\text{m}$
- Impact Cycle  $C=200/\text{h}$
- Installation Location( $R_s$ )= $0.6\text{m}$

$$I(\text{Moment of Inertia}) = m \cdot K^2 = 500 \times 0.8^2 = 320 \text{Nm/s}^2$$

$$\omega = \frac{V}{K} = \frac{2}{0.8} = 2.5 \text{rad/s}$$

$$E_K = \frac{I \cdot \omega^2}{2} = \frac{320 \times 2.5^2}{2} = 1000 \text{Nm}$$

$$F = \frac{m \cdot g \cdot K}{R_s} = \frac{500 \times 9.8 / 0.8}{0.6} = 6533.3 \text{N}$$

Model Temporary : KHA 85 – 50(Stroke: 50)

$$E_W = F \cdot S = 6533.3 \times 0.05 = 326.7 \text{Nm}$$

$$E_T = E_K + E_W = 1000 + 326.7 = 1326.7 \text{Nm}$$

$$E_{TC} = E_T \cdot C = 1326.7 \times 200 = 265340 \text{Nm/h}$$

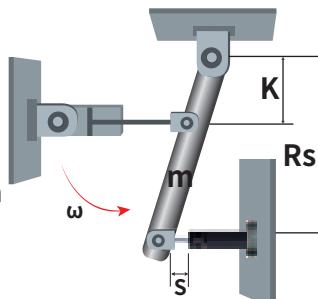

$$V = R_s \cdot \omega = 0.6 \times 2.5 = 1.5 \text{m/s (at shock Absorber)}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 1326.7}{1.5^2} = 1179.3 \text{kg}$$

Model : KHA 85 – 50

## J. Swiveling Mass With Propelling Force

- Working Pressure  $P=5\text{bar}$
- Weight  $m=600\text{kg}$
- Angular Velocity  $\omega=3\text{rad/s}$
- Rotation Radius  $K=0.6\text{m}$
- Installation Location( $R_s$ )= $0.8\text{m}$
- Cylinder Bore  $d=80\text{mm}$
- Cylinder Location  $r=0.6\text{m}$
- Impact Cycle  $C=150/\text{h}$

$$I(\text{Moment of Inertia}) = m \cdot K^2 = 600 \times 0.6^2 = 216 \text{Nm/s}^2$$

$$E_K = \frac{I \cdot \omega^2}{2} = \frac{216 \times 3.0^2}{2} = 972 \text{Nm}$$

$$F = \frac{0.0785 \cdot d^2 \cdot P \cdot K}{R_s} = \frac{0.0785 \times 80^2 \times 5 \times 0.6}{0.8} = 1884 \text{N}$$

Model Temporary : KHA 64 – 50(Stroke: 50)

$$E_W = F \cdot S = 1884 \times 0.05 = 94.2 \text{Nm}$$

$$E_T = E_K + E_W = 972 + 94.2 = 1066.2 \text{Nm}$$

$$E_{TC} = E_T \cdot C = 1066.2 \times 150 = 159930 \text{Nm/h}$$

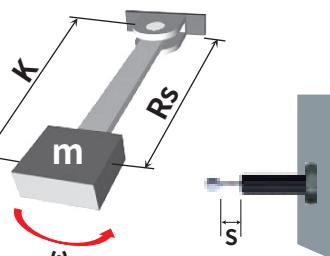

$$V = R_s \cdot \omega = 0.8 \times 3 = 2.4 \text{m/s (at shock Absorber)}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 1066.2}{2.4^2} = 370.2 \text{kg}$$

Model : KHA 64 – 50

## K. Horizontal Rotation Movement

- Weight  $m=50\text{kg}$
- Angular Velocity  $\omega=1.5\text{rad/s}$
- Impact Cycle  $C=140/\text{h}$
- Rotation Radius  $K=0.8\text{m}$
- Installation Location( $R_s$ )= $0.6\text{m}$

$$I(\text{Moment of Inertia}) = m \cdot K^2 = 50 \times 0.8^2 = 32 \text{Nm/s}^2$$

$$E_K = \frac{I \cdot \omega^2}{2} = \frac{32 \times 1.5^2}{2} = 36 \text{Nm}$$

Model Temporary : KMA 25 – 25(Stroke: 25)

$$E_W = 0$$

$$E_T = E_K + E_W = 36 + 0 = 36 \text{Nm}$$

$$E_{TC} = E_T \cdot C = 36 \times 140 = 5040 \text{Nm/h}$$

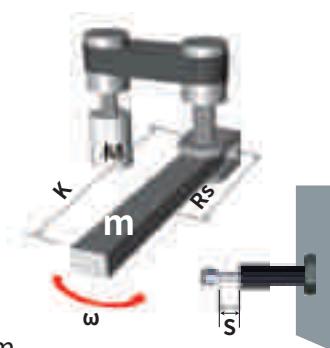

$$V = R_s \cdot \omega = 0.6 \times 1.5 = 0.9 \text{m/s (at shock Absorber)}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 36}{0.9^2} = 88.9 \text{kg}$$

Model : KMA 25 – 25

## L. Horizontal Rotation Movement (With Torque)

- Weight  $m=120\text{kg}$
- Angular Velocity  $\omega=2.0\text{rad/s}$
- Impact Cycle  $C=160/\text{h}$
- Rotation Radius  $K=0.9\text{m}$
- Torque  $T=130\text{Nm}$
- Installation Location( $R_s$ )= $0.6\text{m}$

$$I(\text{Moment of Inertia}) = m \cdot K^2 = 120 \times 0.9^2 = 97.2 \text{Nm/s}^2$$

$$E_K = \frac{I \cdot \omega^2}{2} = \frac{97.2 \times 2.0^2}{2} = 194.4 \text{Nm}$$

$$F = \frac{T}{R_s} = \frac{130}{0.6} = 217 \text{N}$$

Model Temporary : KMA 36 – 50(Stroke: 50)

$$E_W = F \cdot S = 217 \times 0.05 = 10.9 \text{Nm}$$

$$E_T = E_K + E_W = 194.4 + 10.9 = 205.3 \text{Nm}$$

$$E_{TC} = E_T \cdot C = 205.3 \times 160 = 32848 \text{Nm/h}$$

$$V = R_s \cdot \omega = 0.6 \times 2.0 = 1.2 \text{m/s}$$

$$m_e = \frac{2 \cdot E_T}{V^2} = \frac{2 \times 205.3}{1.2^2} = 285.1 \text{kg}$$

Model : KMA 36 – 50 or KHA 42 – 25

## Hydraulic Shock Absorbers

KMA Series

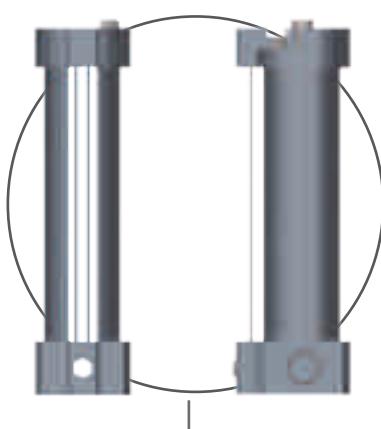

KMS Series

KSA Series

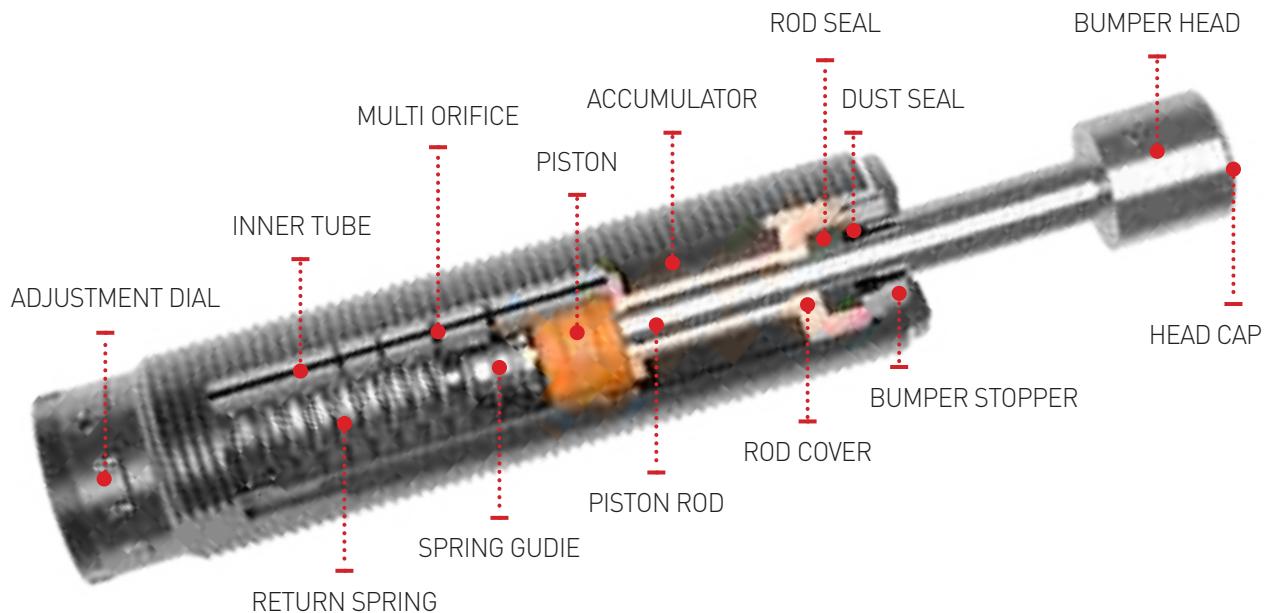

KHA Series

Oil Tank & Check Valve Series

# KMA Series Adjustable Type

When the object collides, the Piston Rod is pushed into the Body, and Oil is stored in the Accumulator through Groove formed along the outer space of Inner Tube. During the process, kinetic energy is converted into heat energy and the heat is dissipated into atmosphere and then damping force occur. The Piston Rod is returned to the original position by the power of Return Spring.

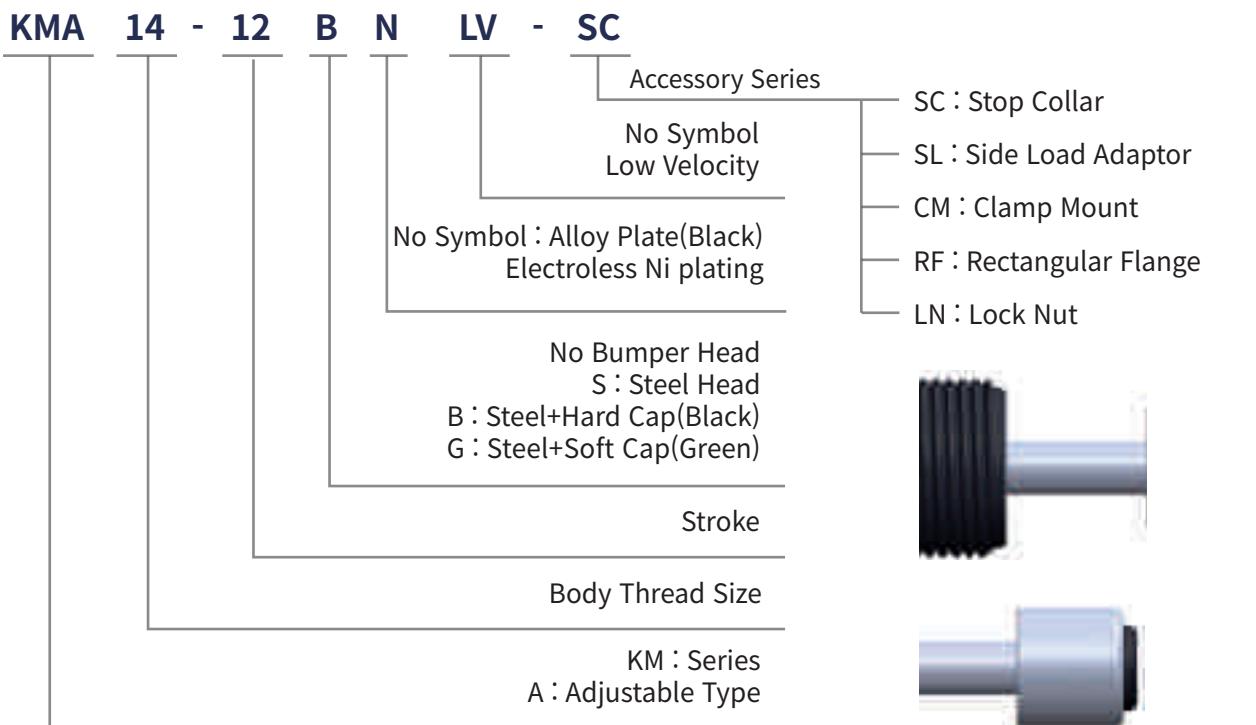

## Feature

- Adjustable to control damping force according to impact velocity by 12 steps from 0° to 300°.
- KMS Series is made as one Body type, that makes it solid and solves piston shooting trouble.
- Fully threaded Body for highest mounting flexibility and improved thermal energy dissipation to the atmosphere.
- Thanks to full threaded Body KMS Series is easy to be installed and precise location fixing is possible. And surface area is increased to dissipate thermal energy fast to atmosphere.
- Piston Rod is made of anticorrosion material and Rod Cover is made of long lasting material with function of seal protection and that enable to guarantee long life.
- Body surface is Electroless Ni plated or Alloy plated, so that strong to corrosion.
- Several options of Bumper Head material - steel, black standard PU, green soft PU
- Velocity ranges : 0.3~5.0m/s, Low Velocity(LV) 0.08~1.3m/s
- Temperature ranges : -10~80°C
- Special specification custom made : Can be made to order according to characteristics such as head, stainless, low temperature and high temperature.  
: Option -40~120°C(Special oil and seal)

## Application

- ✓ Pick N place Robot, Packing Machine, Machine Tool, Automobile Assembly Line, Tire Manufacturing Line, Casting Plant, Crane, Safety devices and all other areas of multi purposes.

## KMA Accessories Installation

NAME	Accessories	Installation	Remark
Lock Nut			As a basic mounting way, by using Lock nut shock absorber can be installed nut, easily.
Stop Collar + Lock Nut			Stop Collar makes it easy to stop precisely and easy to select location to set and it prevents troubles so called bottom-out(piston shooting) problem in the position.
Side Load Adapter + Lock Nut			Main application is rotational motion control, and when the center distance of the shock absorber is inevitably short, it can helps to prevents prevents one sided wear trouble of Shock Absorber Piston Rod.
Flange Mount			By using Flange or Rectangular Flange, Shock Absorber can be fixed conveniently.
Clamp Mount			By Clamp Mount location adjustment and installation are easy. It is possible to mount it on single side or both sides of shock absorber.

# KMS Series Self Compensating Type

KMS is Slot Metering Type, which gradually decrease the impact force and smoothly stops when an object collides. Compared to existing products, the energy absorption capacity has increased by more than 200%, and the range of weight effect and absorption energy per hour is also increased.

## Feature

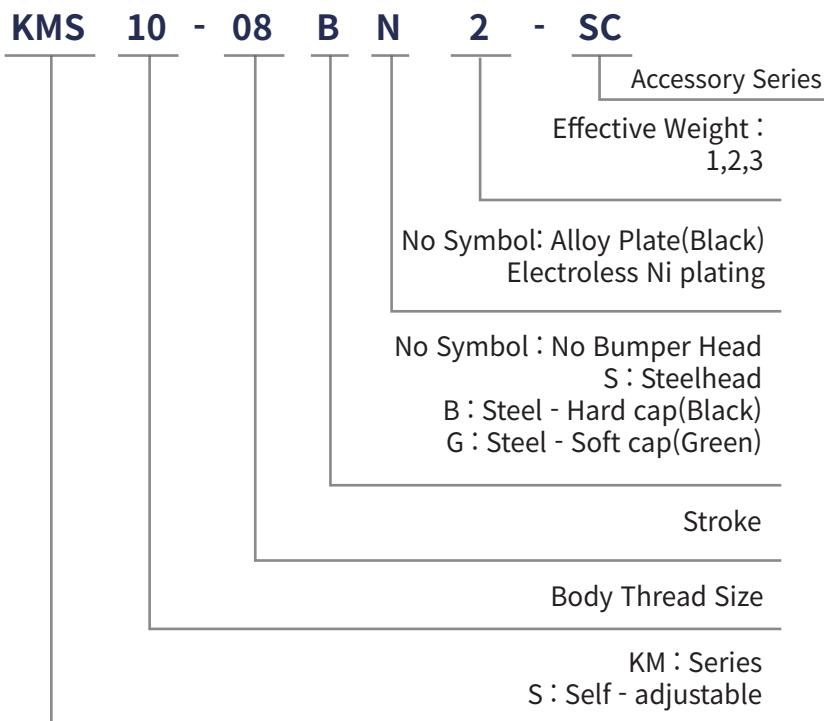

- As the piston size is increased, the energy absorption capacity is increased by 2~3 times compared to the existing products, and the energy per hour is upgraded with the increase of the oil amount, and the effective weight range is widely increased.
- Shock Absorber Body is built as one body, not only robust but also fundamentally helpful to solve problem so called bottom out trouble.
- Fully threaded Body for mounting flexibility and improved thermal energy dissipation to the atmosphere.
- Piston Rod is made of anticorrosion material and Rod Cover is made of long lasting material with function of seal protection and that enable to guarantee long life.
- Body surface is Electroless Ni plated or Alloy plated, so that strong to corrosion.
- Several options of Bumper Head material - steel, black standard PU, green soft PU
- Velocity ranges : 0.3~5.0m/s
- Temperature ranges : -10~80°C
- Special specification custom made : Can be made to order according to characteristics such as thread, stainless, low temperature and high temperature.  
: Option -40~120°C(Special oil and seal)

## Application

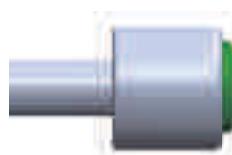

- ✓ Pick N place Robot, Packing Machine, Machine Tool, Automobile Assembly Line, Tire Manufacturing Line, Casting Plant, Crane, Safety devices and all other areas of multi purposes.

## KMS Accessories Installation

NAME	Accessories	Installation	Remark
Lock Nut			As a basic mounting way, by using Lock nut, shock absorber can be installed easily.
Stop Collar + Lock Nut			Stop Collar makes it easy to stop precisely and easy to select location to set and it prevents troubles so called bottom-out(piston shooting) problem in the position.
Side Load Adapter + Lock Nut			Main application is rotational motion control, and when the center distance of the shock absorber is inevitably short, it can help to prevent one sided wear trouble of Shock Absorber Piston Rod.
Flange Mount			By using Flange or Rectangular Flange, Shock Absorber can be fixed conveniently.
Clamp Mount			By Clamp Mount location adjustment and installation are easy. It is possible to mount it on single side or both sides of shock absorber.

# KSA Series Adjustable Type

When the object collides, the shock absorber piston rod is pushed into the body, and the oil moves to the oil chamber through the groove formed along the outskirt of the inner tube. During this process, kinetic energy is transformed into heat energy and dissipates into the atmosphere, resulting in damping force. When the load is removed, the Piston Rod is returns to its original position by the compressed power of return spring. Middle piston adjustment dial is one of the feature.

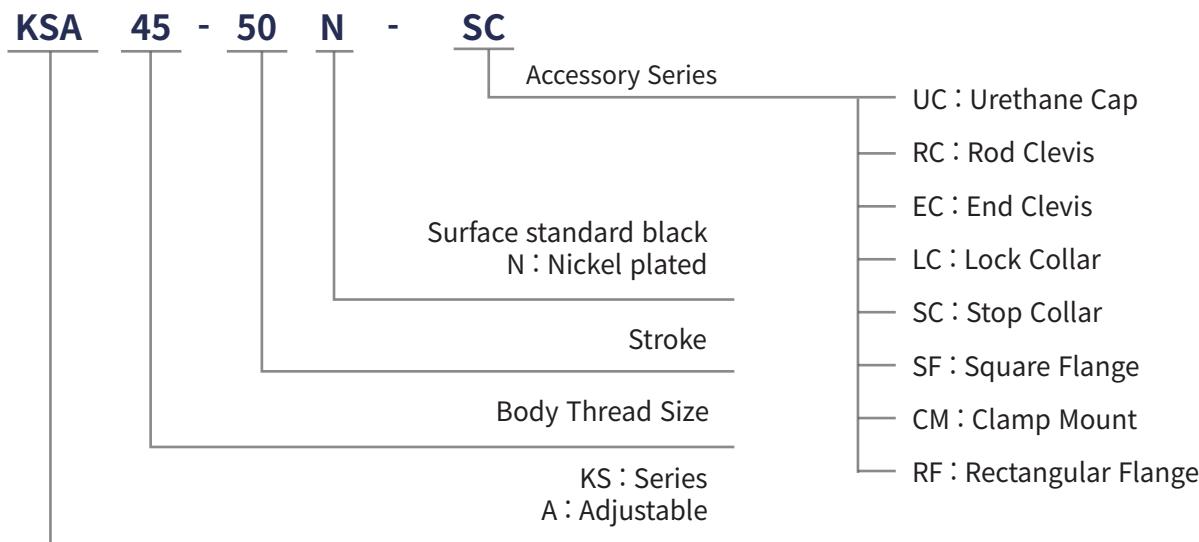

## Feature

- Depending on the collision speed, you can fit the buffer dial from 0 to 300 degrees in 12 steps.
- Adjustment is easy in various installation environment by adopting front and rear adjustmenet dial.
- Shock Absorber Body is built as one body, not only robust but also fundamentally sovles the trouble so called bottom out problem.
- Because of full threaded body KMS Series is easy to be installed and precise location fixing is possible. And surface area is increased to dissipate thermal energy fast to atmosphere.
- Piston rod is made of anticorrosion material and rod cover is made of long lasting material with function of seal protection and that enable to guarantee long life.
- Body surface is electroless Ni plated or alloy plated, so that strong to corrosion.
- By using Urethane Cap, noise can be reduced.
- Velocity ranges : 0.3~5.0m/s
- Temperature ranges : -10~80°C
- Special specification custom made : Can be made to order according to characteristics such as thead, stainless, low temperature and high temperature.  
: Option -40~120°C(Special oil and seal)

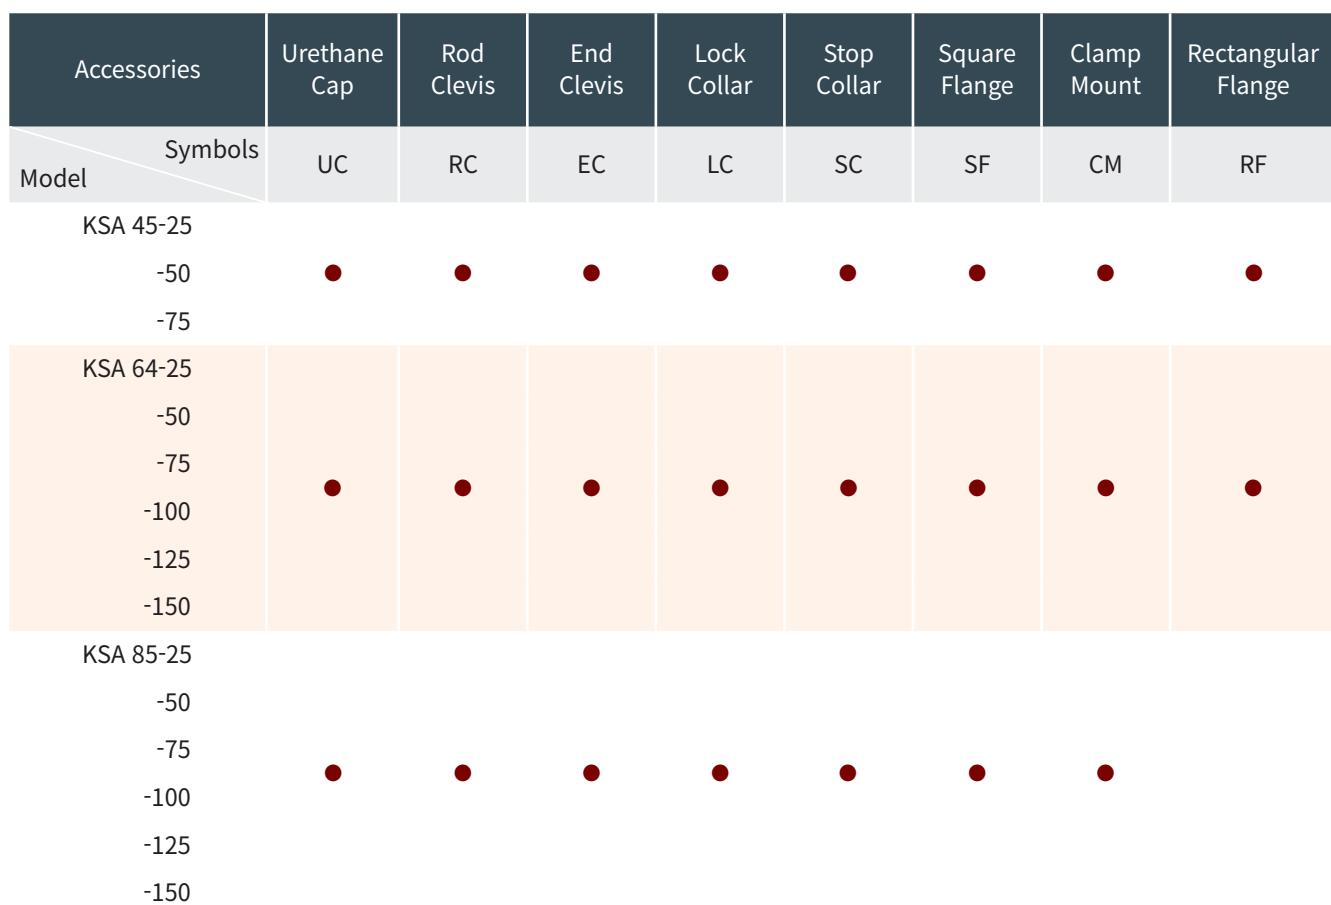

## Application

- ✓ Pick N place Robot, Packing Machine, Machine Tool, Automobile Assembly Line, Tire Manufacturing Line, Casting Plant, Crane, Safety devices and all other areas of multi purposes.

# KSA Series Adjustable Type

## KSA Accessories Installation

NAME	Accessories	Installation	Remark
Lock Collar			As a basic mounting way, by using Lock nut, shock absorber can be installed easily.
Stop Collar + Lock Collar			Stop Collar makes it easy to stop precisely and easy to select location to set and it prevents troubles so called bottom-out(piston shooting) problem in the position.
Flange Mount			By using Flange or Rectangular Flange, Shock Absorber can be fixed conveniently.
Clamp Mount			It can help to use on long shock absorber body settlement.
Clevis Mount			Main application is for cycle movement and it can help to decelerate indirectly and it can prevent damage from side load.

# KHA Series Adjustable Type

When the object collides, the piston rod is pushed into the body, and oil is stored as an accumulator as much as the volume of the piston rod that came into the body through the inner tube and the outer tube's orifice. During this process, kinetic energy is transformed into heat energy and dissipates into the atmosphere, resulting in damping force. When the load is removed, the piston rod is returned to its original position by the force of the compressed return spring.

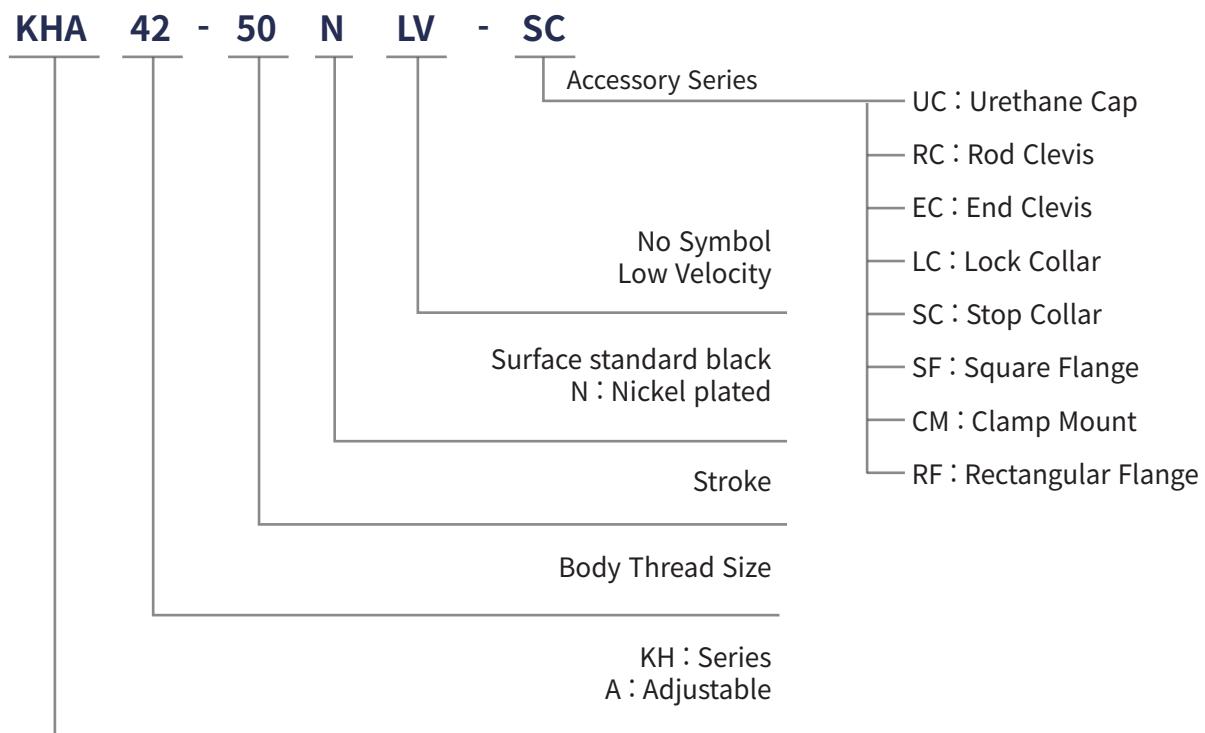

## Feature

- The Adjustment Dial is rotated from 0 to 180 degrees from left to right to freely adjust the buffering range according to the impact speed.
- The body is threaded to increase the surface area, and it dissipates thermal energy which was transformed by impact energy faster, and it can adjust the position when mounting, which makes it easy to fix the position accurately.
- Piston Rod is made of anticorrosion material and Rod Cover is made of long lasting material with function of seal protection and that enable to guarantee long life.
- Shock Absorber Bumper Head Urethane Cap for low impact noise.
- Body surface is Electroless Ni plated or Alloy plated, so that strong to corrosion.
- Velocity ranges : 0.3~5.0m/s, Low Velocity(LV) 0.08~1.3m/s
- Temperature ranges : -10~80°C
- Special specification custom made : Can be made to order according to characteristics such as head, stainless, low temperature and high temperature.  
: Option -40~120°C(Special oil and seal)

## Application

- ✓ Pick N place Robot, Packing Machine, Machine Tool, Automobile Assembly Line, Tire Manufacturing Line, Casting Plant, Crane, Safety devices and all other areas of multi purposes.

## KHA Accessories Installation

NAME	Installation	Remark
Lock Collar		Installation is simply done by fastening Lock Collar. This is basic installation.
Stop Collar + Lock Collar		Stop Collar guarantees accurate stopping and positioning and protects piston shooting problem (so called "Bottom-out" problem) of Piston.
Flange Mount		Use to Square Flange or Rectangular Flange to conveniently fix Shock Absorber.
Clamp Mount		Clamp mount is used in horizontal installation usually specially if the shock absorber is long.
Clevis Mount		Clevis mount is used in rotation movement to absorb the collision force indirectly and protect from unbalanced shock absorption.

# Air Oil Tank & Check Valve Series

It is used by connecting pipes to Shock Absorber main body and Air Oil Tank, and supplying air to the inside of Air Oil Tank. By using Air Oil Tank, the accumulated heat generated inside the shock absorber is released more effectively, thus increasing the number of cycles per hour, extending the life of the shock absorber, No Return Spring is required and it is able to control Shock Absorber return time & speed.

## Feature

- Working pressure : 3~7bar (guarantee pressure 10bar)
- Temperature ranges : -10~80°C
- How to use : It is necessary to refill oil between 0~L
- ✓ Notes
  1. Air Oil Tank should be installed above the shock absorber.
  2. The air inside the unit must be removed before operation.
  3. When checking the Air Oil Tank, check pressure inside the check valve you must work after removing pressure.

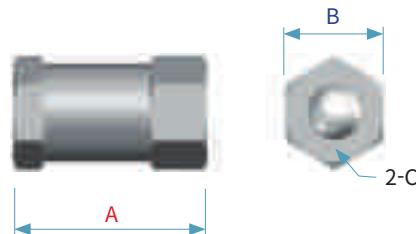

### Dimensions (unit : mm)

MODEL	A	B	C	D	E	F	G	4-ØH	Application MODEL
KHO63-100	286	88	105	25	64	PT3/4	PT3/8	15	KHA42, KHA64 Series
KHO100-150	398	135	153	30	93	PT3/4	PT3/8	15	KHA85, KHA115 Series

### Check Valve

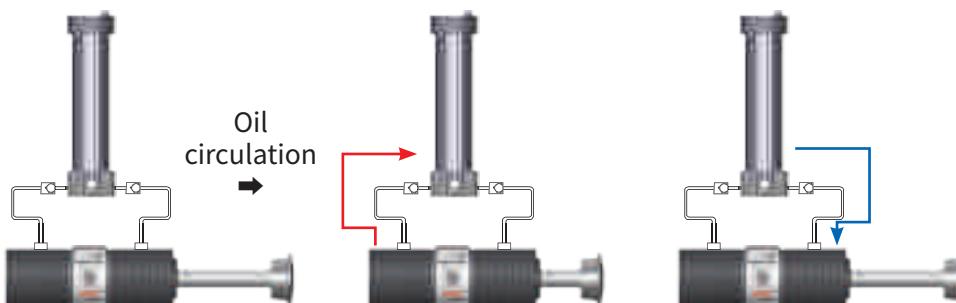

Check valve has the function of controlling the directions of hydraulic flow in Shock Absorber and Air Oil Tank.

MODEL	A	B	C
KC 1/4	35	24	PT 1/4
KC 3/8	35	24	PT 3/8
KC 1/2	40	40	PT 1/2
KC 3/4	60	48	PT 3/4

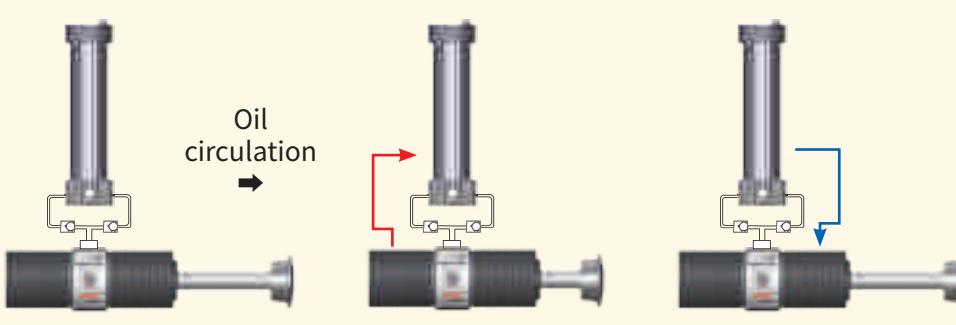

## Application

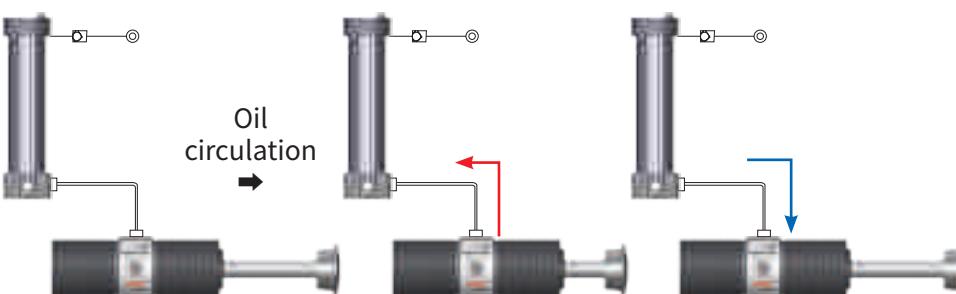

### Circuit

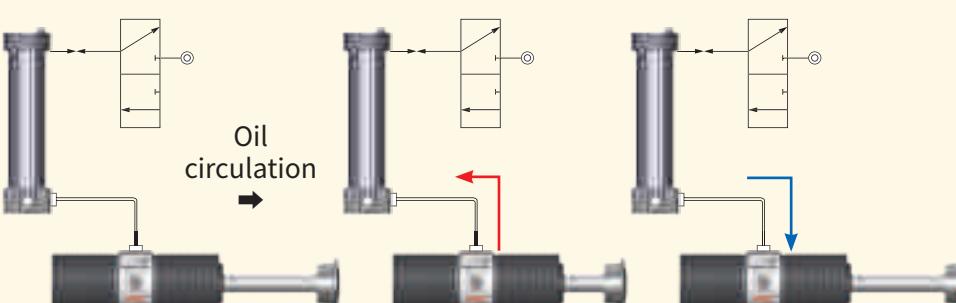

The best circuit to dissipate impact energy and it can increase cycles per hour.

When it using cooling circuit, high tempered oil transfers to tank and cool down oil supplied from shock absorber internal route and it can increase cycles per hour. For high speed application.

Piston rod returned to its original position after operation cycle.

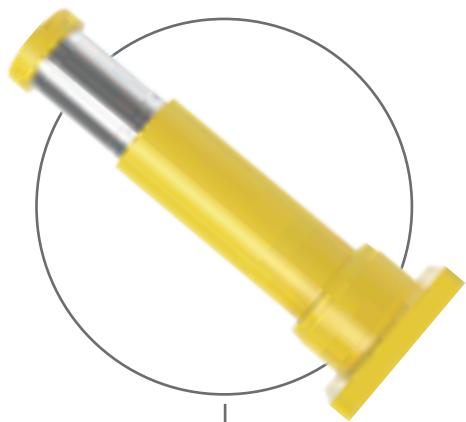

Return control is possible when air valve is applied to shock absorber.

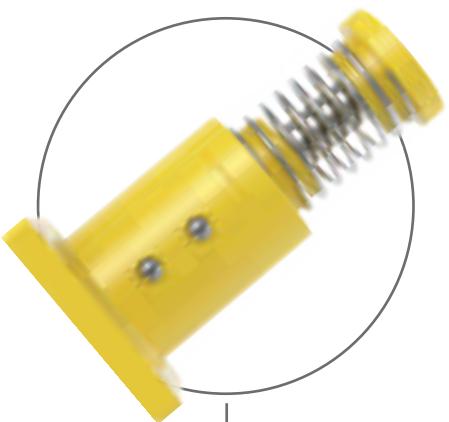

**KOBA**  
BEST SHOCK ABSORBER

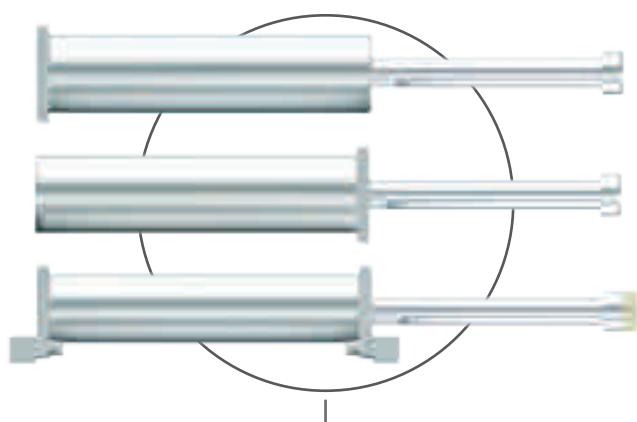

## Hydraulic Buffer

**KHG Series**

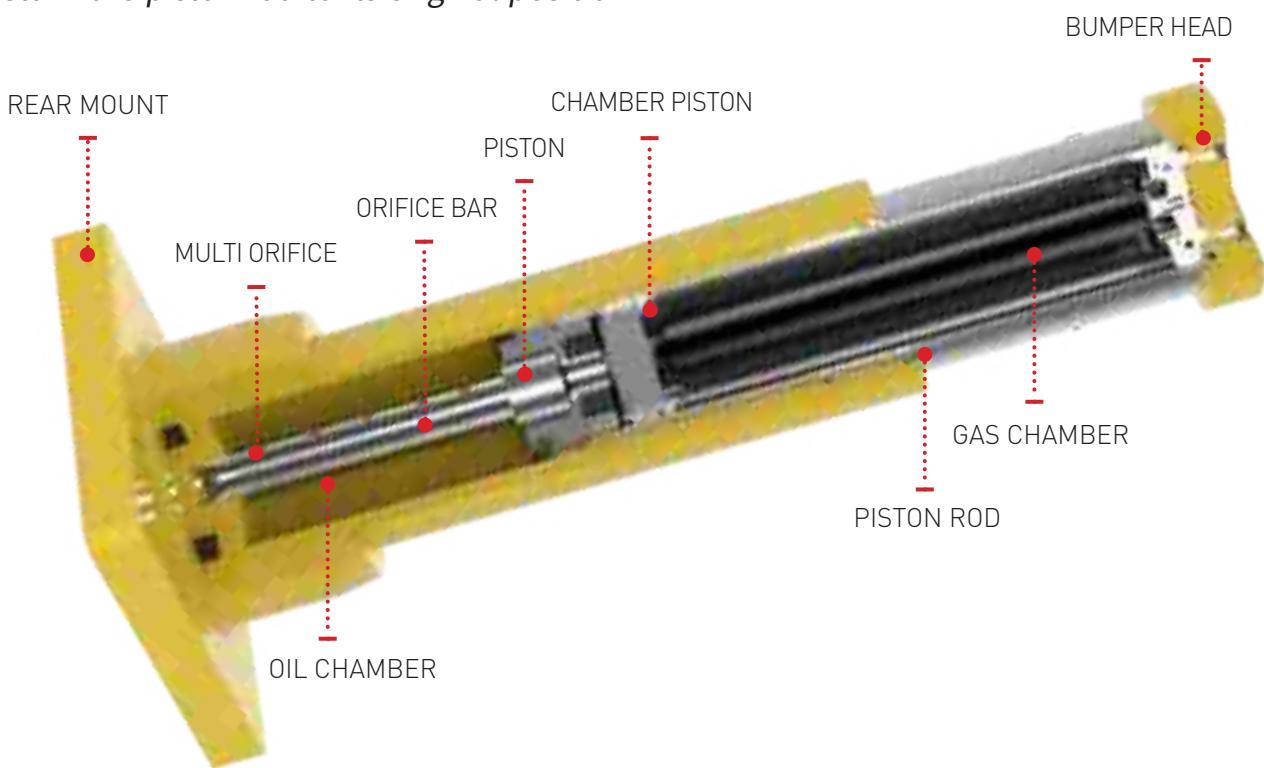

**KHS Series**

**KCSC Series**

# KHG Series Hydraulic Buffer

When the moving object collides with the bumper head, the internal check valve is closed and the oil chamber is compressed. The compressed oil flows into the orifice bar through the multiple orifice hole and it absorbs the shock. In addition, as the piston rod enters the inside of oil chamber, the oil amount as much as the piston rod volume presses the chamber piston to compress the gas chamber (performs the accumulator function), so that the pressure inside the gas chamber is increased, absorbs shock energy over the entire stroke ranges. When the shock absorption is completed, the compressed gas chamber is forced to the oil chamber area, and the check valve installed in the piston is opened to return the piston rod to its original position.

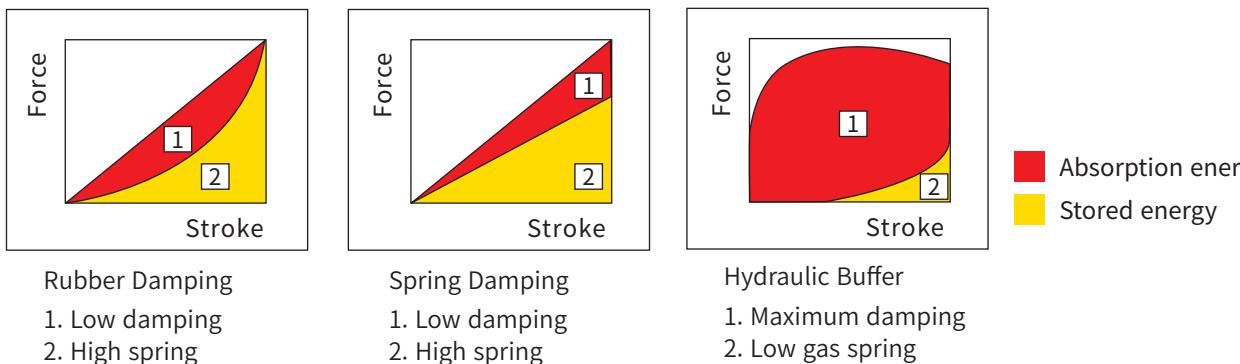

## Feature

- KHG buffer safely protect heavy machinery and equipment during transfer of heavy loads. The high-capacity buffer are individually designed to decelerate moving loads under various conditions in compliance with industry mandatory international standards such as OSHA, CMAA, AIST, DIN, FEM etc.
- Adjustment type : Self adjustment type
- Applied fluid : Oil + Nitrogen Gas
- Temperature ranges : Standard (-10~80°C), Special (-30~100°C)
- Return mediator : Nitrogen Gas
- Piston Rod : Hard Chrome (25μm or more)
- Body and Mount : Epoxy Paint Coatings

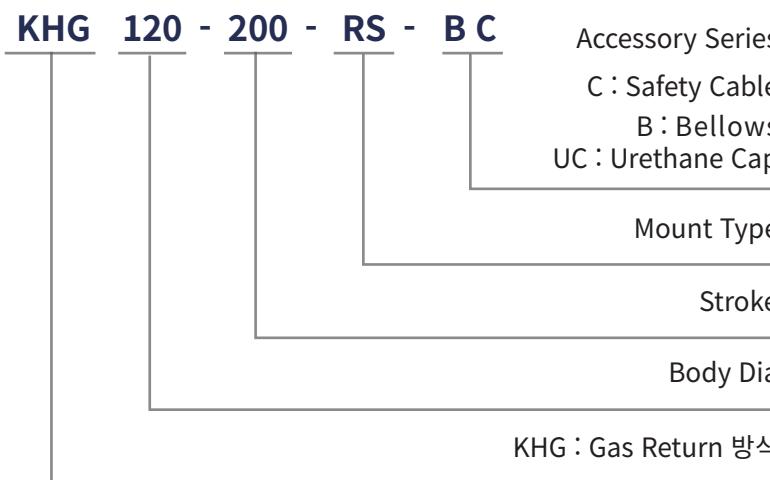

## Application

- ✓ Container crane, Overhead crane, Stacker crane, Transfer car, Amusement park, Railway, Steel mill and all other areas of multi purposes.

# KHS Series Hydraulic Buffer

When the moving load is collided to bumper head, the piston rod enters inner tube according to stroke and check valve is closed with the oil chamber compressed. The oil in chamber is absorbed the impact force by discharging through multiple orifice.

After absorption of impact force, compressed piston rod is returned to original position by external return spring.

## Feature

- As heavy buffer products, it optimized by customized orifices to develop high decelerate efficiencies. It is proper to apply emergency & production lines which requires repeat movements. It meets global industrial safety standards like OSHA, AIST, CMAA, DIN, FEM, etc.
- Adjustment type : Self adjustment type
- Applied fluid : Oil
- Temperature ranges : Standard (-10~80°C), Special (-30~100°C)
- Return mediator : Coil Return Spring
- Piston Rod : Hard Chrome (25μm or more)
- Body and Mount : Epoxy Paint Coatings

## Application

- ✓ STS crane, Goliath crane, Stacker crane, Transfer car, Amusement park, Railway, Steel mill and all other areas of multi purposes.

# KCSC Series Stacker Crane Buffer

KCSC Series is Gas Return Type and its gas amount is designed to be relatively larger than oil amount, so it has low peak and low recoil force. Therefore, it operates with minimum resistance during normal operation and safely decelerates in case of emergency.

KCSC Series is mainly used for stacker crane of automated logistics system. It has standard products with Stroke up to 1,500mm and energy absorption capacity up to 800kJ, and other special specifications can be produced on the basis of order made. Also it follows industrial safety standards such as OSHA, AIST, CMMA, DIN, FEM, etc.

## Feature

- Standard impact velocity : 3.8m/s
- Temperature ranges : Standard (-10~80°C), Special (-30~100°C)
- Return mediator : Nitrogen Gas
- Piston Rod : Hard Chrome (25μm or more)
- Body and Mount : Epoxy Paint Coatings

## Application

- ✓ Stacker crane, amusement park, car production line, overhead crane, logistics warehouse automation system and all other areas of multi purposes.

## Options

- ✓ Protective Bellows
- ✓ Safety Cable
- ✓ Urethane Cap
- ✓ Mounting Plates
- ✓ Foot Mounts
- ✓ Sensor

## Visco-Elastic Buffer

KESM Series

KESE Series

KESH Series

KVD Series

# KES Series Visco-Elastic Buffer

*KES Series is developed on behalf of spring or shock absorber by fluid statics' compression principle and even it is simple and robust but can exert a large damping force despite of small return device such as appearance.*

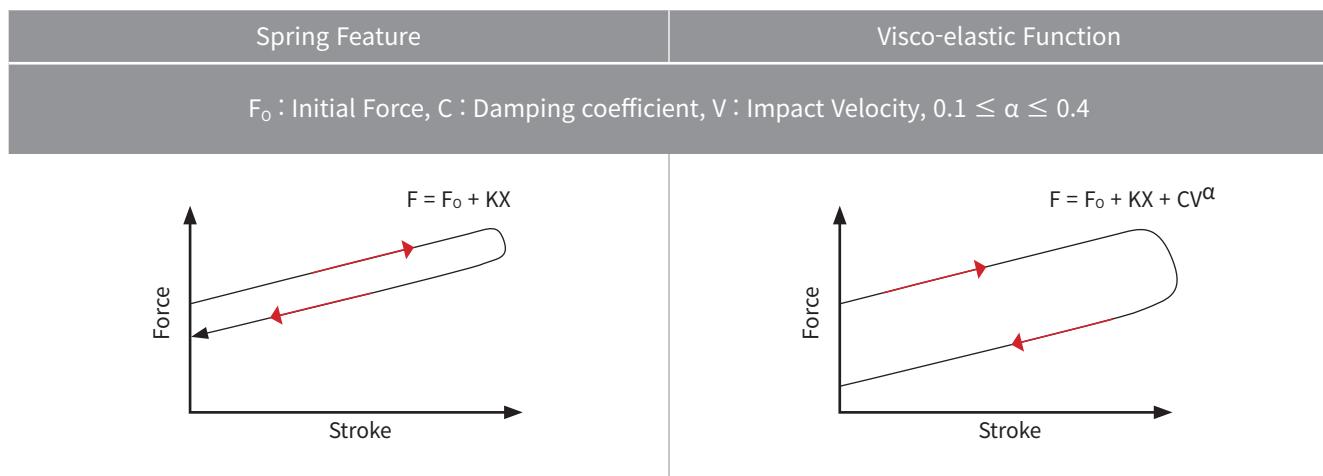

*Because KES Series has spring and shock absorption function in one structure, Gas spring and Coil Spring is not needed and has a long lasting feature of damping performance in wide temperature range.*

## Feature

- Standard impact velocity : 3.8m/s
- Temperature ranges : Standard (-10~80°C), Special (-30~100°C)
- Piston Rod : Hard Chrome (25μm or more)
- Body and Mount : Epoxy Paint Coatings

## Application

- ✓ For protection in wide industrial impact protection, especially Firewall, Cars, Railways, Marine Industry, Steel, paper, etc.

## KES Series Ordering Information

**KES M - 116 - 50 - RF**

RS : Rear Flange  
FS : Front Flange  
FM : Foot Mount

Stroke

Body Dia

Model : M, E, S, H

Series

# KES Series Visco-Elastic Buffer

## // Model selection guide

### Example : KESM Series

- Impact velocity ( $V_e$ ) : 1.5 m/s
- Impact mass ( $m_e$ ) : 5 ton
- Impact frequency : 20 impact/h

### 1. Energy calculation (E)

$$E_T = \frac{1}{2} m_e V_e^2$$

$$E = \frac{1}{2} \times 5,000 \times 1.5^2 = 5,625 \text{ Nm} = 5.6 \text{ kJ}$$

### 2. Temporary Model Selection

KESM90-60

$$E_T = 7 \text{ [kJ]} \quad (E < E_T)$$

KESS50-150

$$E_T = 6 \text{ [kJ]}$$

### 3. Allowable Impact Frequency

■ Case1 : KESM90-60       $C_e = 20 < 20 \cdot \frac{E_T}{E} = 20 \cdot \frac{7}{5.6} = 25 \text{ [impact/h]}$

■ Case2 : KESS50-150       $C_e = 20 > 8 \cdot \frac{E_T}{E} = 8 \cdot \frac{6}{5.6} = 8.57 \text{ [impact/h]} \quad (\text{dissatisfaction})$

### 4. Required Stroke Calculation

$$\begin{aligned} S_e &= S \left( \sqrt{\frac{E}{E_T(0.03V + 0.24)}} + 1.36 - 1.17 \right) \\ &= 60 \left( \sqrt{\frac{5.6}{7(0.03 \times 1.5 + 0.24)}} + 1.36 - 1.17 \right) = 52.3[\text{mm}] \end{aligned}$$

### 5. Calculation of Effective Reaction

$$\begin{aligned} F_{ME} &= \left[ \left( \frac{RD_{max} - RD_{min}}{S} \right) S_e + RD_{min} \right] (0.1 \times V_e + 0.8) \\ &= \left[ \left( \frac{150 - 90}{60} \right) \times 52.3 + 90 \right] (0.1 \times 1.5 + 0.8) = 135.18[\text{kN}] \end{aligned}$$

### 6. Final Model Selection

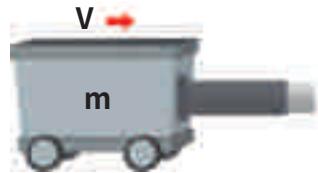

KESM90-60

$E_T$  : Max Energy/cycle (kJ)

# // Model selection guide

## Example : KESE Series

- Impact velocity ( $V_e$ ) : 1.8 m/s
- Impact mass ( $m_e$ ) : 40 ton
- Impact frequency ( $C_e$ ) : 15 impact/h

## 1. Energy calculation (E)

$$E_T = \frac{1}{2} m_e V_e^2 \quad E = \frac{1}{2} \times 40,000 \times 1.8^2 = 64,800 \text{ Nm} = 64.8 \text{ kJ}$$

## 2. Temporary Model Selection

KESE160-140	$E_T = 75 \text{ [kJ]}$	$(E < E_T)$
KESS110-400H	$E_T = 100 \text{ [kJ]}$	

## 3. Allowable Impact Frequency

■ Case1 : KESE160-140	$C_e = 15 < 15 \cdot \frac{E_T}{E} = 15 \cdot \frac{75}{64.8} = 17.36 \text{ [impact/h]}$
■ Case2 : KESS110-400H	$C_e = 15 > 8 \cdot \frac{E_T}{E} = 8 \cdot \frac{100}{64.8} = 12.34 \text{ [impact/h]} \quad (\text{dissatisfaction})$

## 4. Required Stroke Calculation

$$\begin{aligned} S_e &= S \left( \sqrt{\frac{E}{E_T (0.03V + 0.24)}} + 1.36 - 1.17 \right) \\ &= 140 \left( \sqrt{\frac{64.8}{75 (0.03 \times 1.8 + 0.24)}} + 1.36 - 1.17 \right) = 126.47 \text{ [mm]} \end{aligned}$$

## 5. Calculation of Effective Reaction

$$\begin{aligned} F_{ME} &= \left[ \left( \frac{RD_{max} - RD_{min}}{S} \right) S_e + RD_{min} \right] (0.1 \times V_e + 0.8) \\ &= \left[ \left( \frac{700 - 400}{140} \right) \times 52.3 + 90 \right] (0.1 \times 1.8 + 0.8) = 657.87 \text{ [kN]} \end{aligned}$$

## 6. Final Model Selection

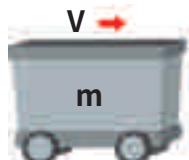

KESE160-140

$E_T$  : Max Energy/cycle (kJ)

## // Model selection guide

### Example : KESS Series

- Impact velocity ( $V_e$ ) : 2.8 m/s
- Impactor mass ( $m_e$ ) : 20 ton
- Impact frequency ( $C_e$ ) : 8 impact/h
- Allowable Reaction Force : 350 kN
- Allowable D1 : 150 mm

### 1. Energy calculation (E)

$$E_T = \frac{1}{2} m_e V_e^2 \quad E = \frac{1}{2} \times 20,000 \times 2.8^2 = 78,400 \text{ Nm} = 78.4 \text{ kJ}$$

### 2. Temporary Model Selection

$$\text{KESS110-400H} \quad E_T = 100 \text{ [kJ]} \quad (E < E_T)$$

### 3. Allowable Impact Frequency

$$C_e = 8 < 8 \cdot \frac{E_T}{E} = 8 \cdot \frac{100}{78.4} = 10.2 \text{ [impact/h]}$$

### 4. Required Stroke Calculation

$$S_e = S \left( \sqrt{\frac{E}{E_T (0.03V + 0.24)}} + 1.36 - 1.17 \right)$$

$$= 400 \left( \sqrt{\frac{78.4}{100 (0.03 \times 2.8 + 0.24)}} + 1.36 - 1.17 \right) = 290.8 \text{ [mm]}$$

### 5. Calculation of Effective Reaction

$$F_{ME} = \left[ \left( \frac{RD_{max} - RD_{min}}{S} \right) S_e + RD_{min} \right] (0.1 \times V_e + 0.8)$$

$$= \left[ \left( \frac{320 - 175}{400} \right) \times 290.8 + 175 \right] (0.1 \times 2.8 + 0.8) = 302.8 \text{ [kN]}$$

### 6. Final Model Selection

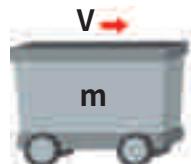

KESS110-400H

$E_T$  : Max Energy/cycle (kJ)

# // Model selection guide

## Example : KESH Series

- Impact velocity ( $V_e$ ) : 2.8 m/s
- Impactor mass ( $m_e$ ) : 80 ton
- Impact frequency ( $C_e$ ) : 8 impact/h
- Allowable Reaction Force : 650 kN

## 1. Energy calculation (E)

$$E_T = \frac{1}{2} m_e V_e^2 \quad E = \frac{1}{2} \times 80,000 \times 2.8^2 = 313,600 \text{ Nm} = 313.6 \text{ kJ}$$

## 2. Temporary Model Selection

$$\text{KESH175-850} \quad E_T = 100 \text{ [kJ]} \quad (E < E_T)$$

## 3. Allowable Impact Frequency

$$C_e = 8 < 8 \cdot \frac{E_T}{E} = 8 \cdot \frac{400}{313.6} = 10.2 \text{ [impact/h]}$$

## 4. Required Stroke Calculation

$$S_e = S \left( \sqrt{\frac{E}{E_T (0.03V + 0.24)}} + 1.36 - 1.17 \right) \\ = 400 \left( \sqrt{\frac{313.6}{400 (0.03 \times 2.8 + 0.24)}} + 1.36 - 1.17 \right) = 658.0 \text{ [mm]}$$

## 5. Calculation of Effective Reaction

$$F_{ME} = \left[ \left( \frac{RD_{max} - RD_{min}}{S} \right) S_e + RD_{min} \right] (0.1 \times V_e + 0.8) \\ = \left[ \left( \frac{600 - 330}{850} \right) \times 658.0 + 330 \right] (0.1 \times 2.8 + 0.8) = 582.1 \text{ [kN]}$$

## 6. Final Model Selection

# KVD Series Elasto-Fluid Heavy Duty Buffer

KVD Series is developed on behalf of spring or shock absorber by fluid statics' compression principle and even it is simple and robust and that can exert a large damping despite of small appearance. Because KVD Series has spring and shock absorption function in one structure, such return device such as Gas spring and Coil Spring is not needed and has a long lasting feature of damping performance in wide temperature range.

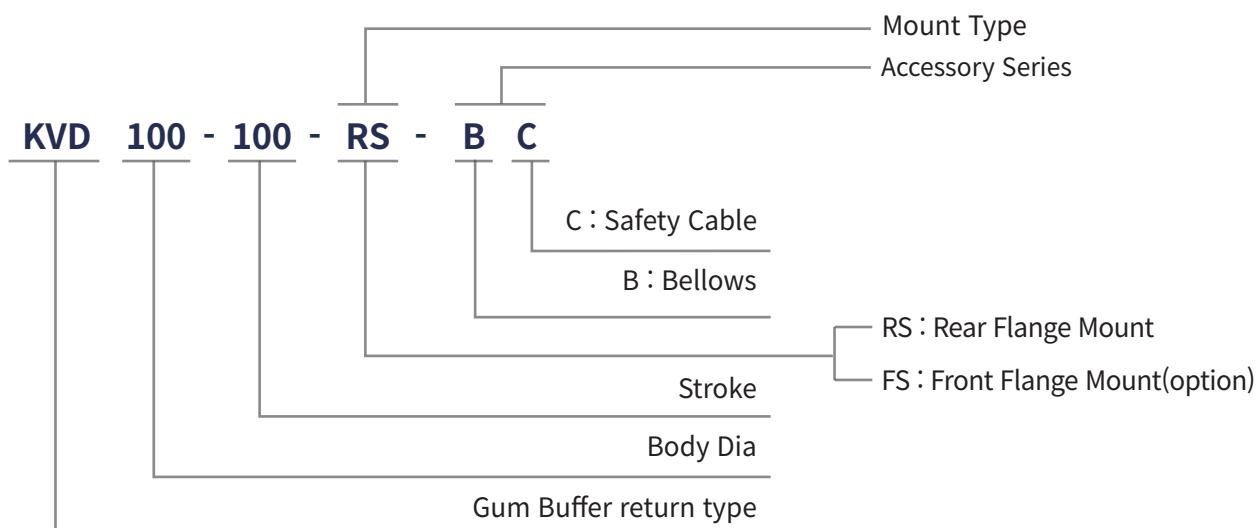

## Feature

- No need of maintenance for a long time because there is no leakage.
- 700kN up to 1,500kN (Order Made possible)
- Temperature ranges : -20~80°C
- Piston Rod : Hard Chrome (25μm or more)
- Impact velocity : 0.02~5m/s
- Bellows and safety cables are optional
- Body Protection : White Zinc Plating
- Special Type - Painting
  - Standard temperature Range : -40°C~120°C

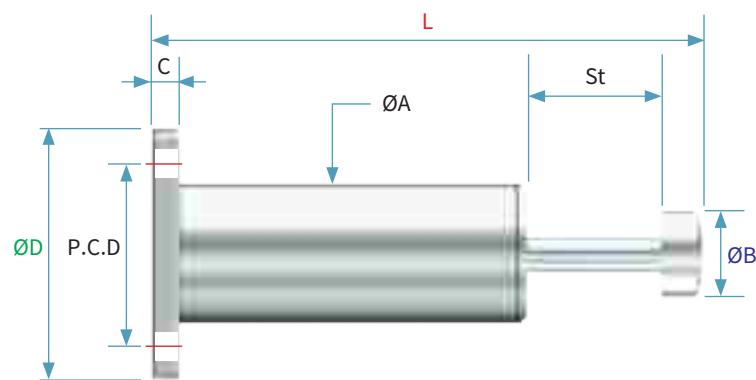

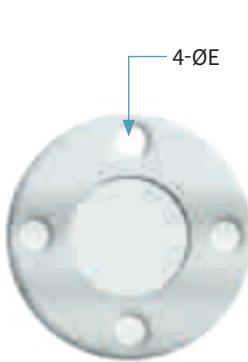

## Application

- ✓ All industries related to Shock absorption and control

# KRC Series Rate Controls

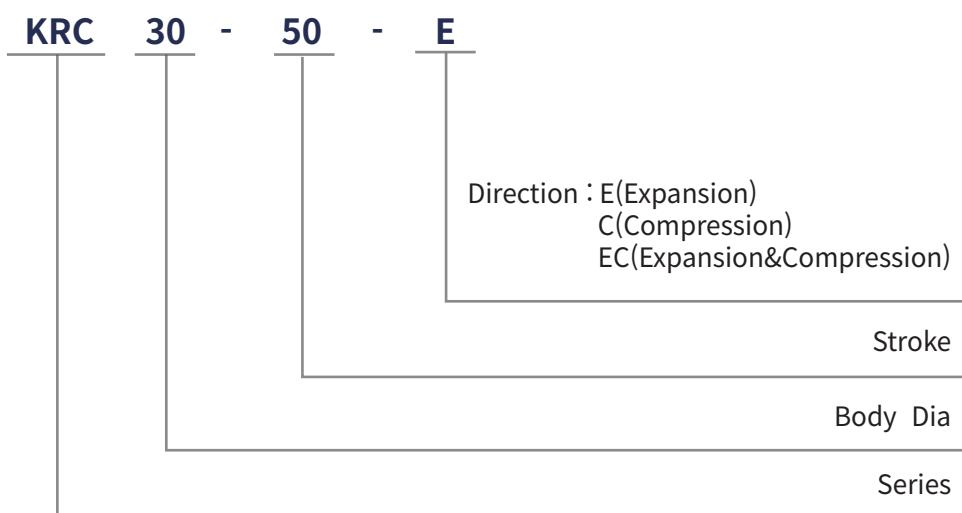

KRC Series is designed for speed control of transfer equipment to both or single side compression and tension. The machine can be controlled for soft and safe movement according to user's environment by controlling specific dial range 0 ~12 steps.

## Feature

- Impact velocity : 0.06m/s
- Temperature ranges : Standard (-10~80°C), Special (-30~100°C)
- Piston Rod : Hard Chrome (25μm or more)
- Body and Mount : Black Plating(Anodizing)
- Applied fluid : Oil

# KHC Series Hydro Check

## Feature

- Hydro Check Series enables precise speed and location control for the moving loads with various strokes
- Hydro Check Series is easy to be installed and controlled, and extend life span because precise transfer is possible by specific control of adjustment knob(to 300°). It is used for auto feed drilling, grinder, cutting, etc
- Piston Rod is made of corrosion proof material and plated body protect damage by working environment
- Easy installment is possible by the accessories of snap ring and mounting block, and location movement and fixation is convenient
- Oil inside of hydro check is self-filtered, so constant speed control is possible and convenient in any working circumstance
- Temperature ranges : Standard (-10~80°C), Special (-30~100°C)
- Applied fluid : Oil

## Application

- ✓ Places where speed control is needed, like drilling, cutting, safety equipment, boring machine, etc

MB 38

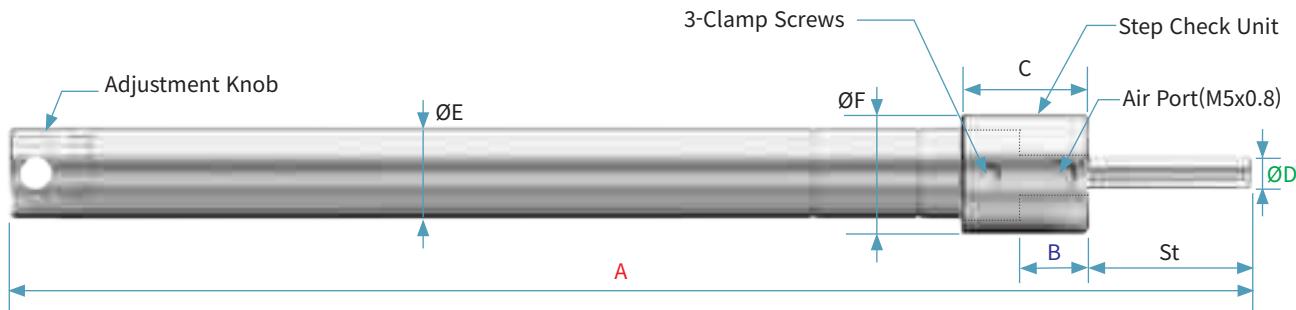

## // Step Check Unit Series

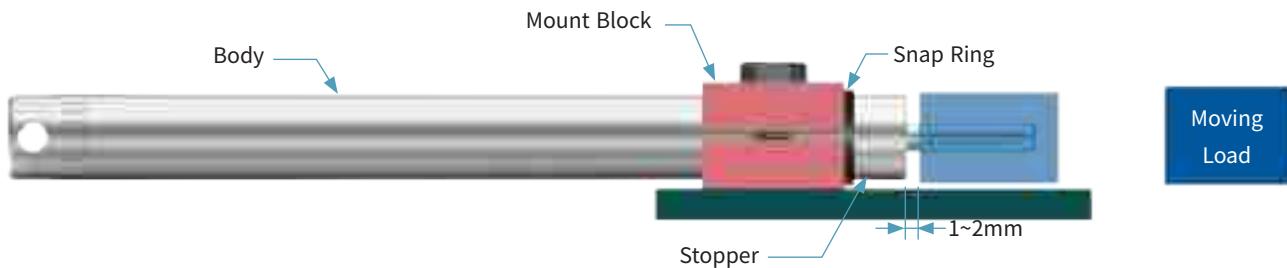

Step Check Unit Series has same speed control function with Hydro Check but it has different function of middle stop as required. It is used in long drilling work, precision work, chips discharge work during operation. Customized order for special requirement is possible.

### Engineering Data & Dimensions

Model	Stroke (mm) St	A (mm)	B (mm)	C (mm)	ØD (mm)	ØE (mm)	ØF (mm)	Return Type	Weight (g)
KHC24-30S	30	224.5							500
-60S	60	332.5						Air Return	685
-90S	90	404.5	22	35	8	23.8	32		795
-120S	120	494.5							935

## // Hydro Check Installation

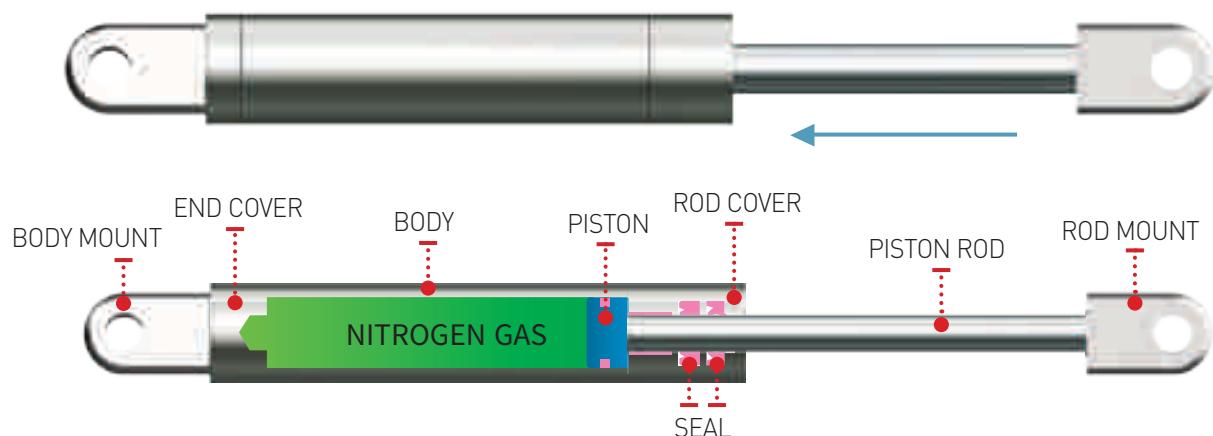

Mount Block installation can be applied to high driving force and Snap Ring prevent products moving

### Cautions

1. Don't lock by bolt and don't have machining hydro check's body(contact us if it is needed).
2. Refer to catalog for the installment angle of hydro check. If instalment location is not proper, uneven wear can be occurred and may cause shorten life span and damage on the products.

# KG Series Compression Type

## Feature

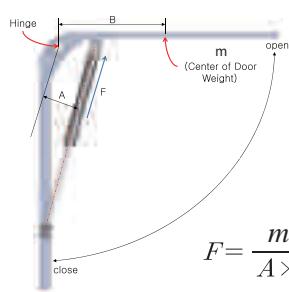

- KG series is used of high pressure nitrogen gas and has extensive spring feature, long stroke, small repulsive force, lifting big loads despite of small unit, speed control in compression status, and strong features of various applications. It has stable force comparing to general plate spring and coil spring.
- Temperature ranges : Standard (-10~80°C), Special (-30~100°C)
- Order made is possible according to size, stroke, force, material(stainless steel), etc.

## Application

✓ Mechanical Machine Cover, Auxiliary Power Unit, Manhole Cover, Machinery, Medical Device, etc.

# KGP Series Extension Type

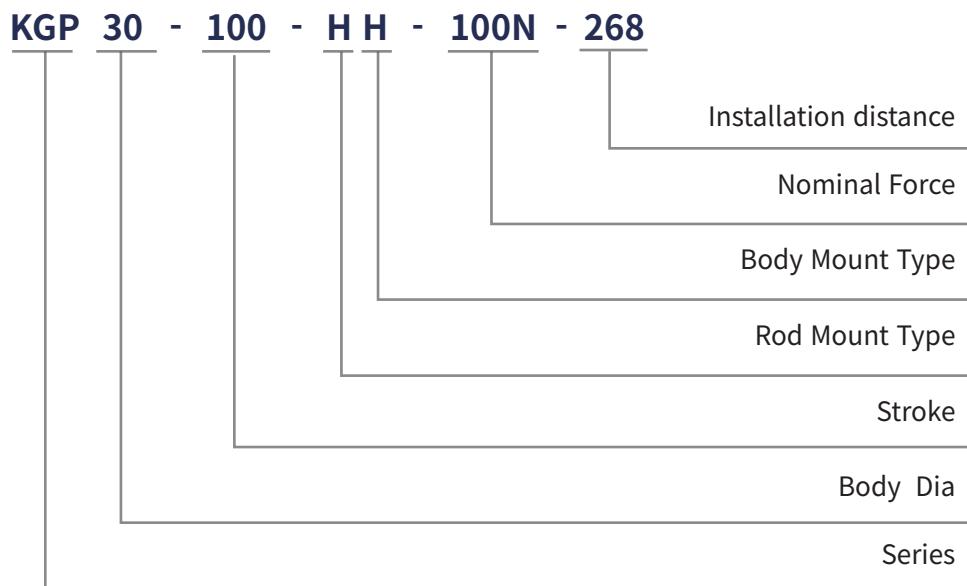

## Feature

- KGP is pull type gas spring. It is widely used for the open/close cover of machine, and the open/close cover of tank container which is horizontally moving. And it is used on semiconductor equipments.
- Temperature ranges : Standard (-10~80°C), Special (-30~100°C)
- Order made is possible according to size, stroke, force, material(stainless steel), etc.

## Application

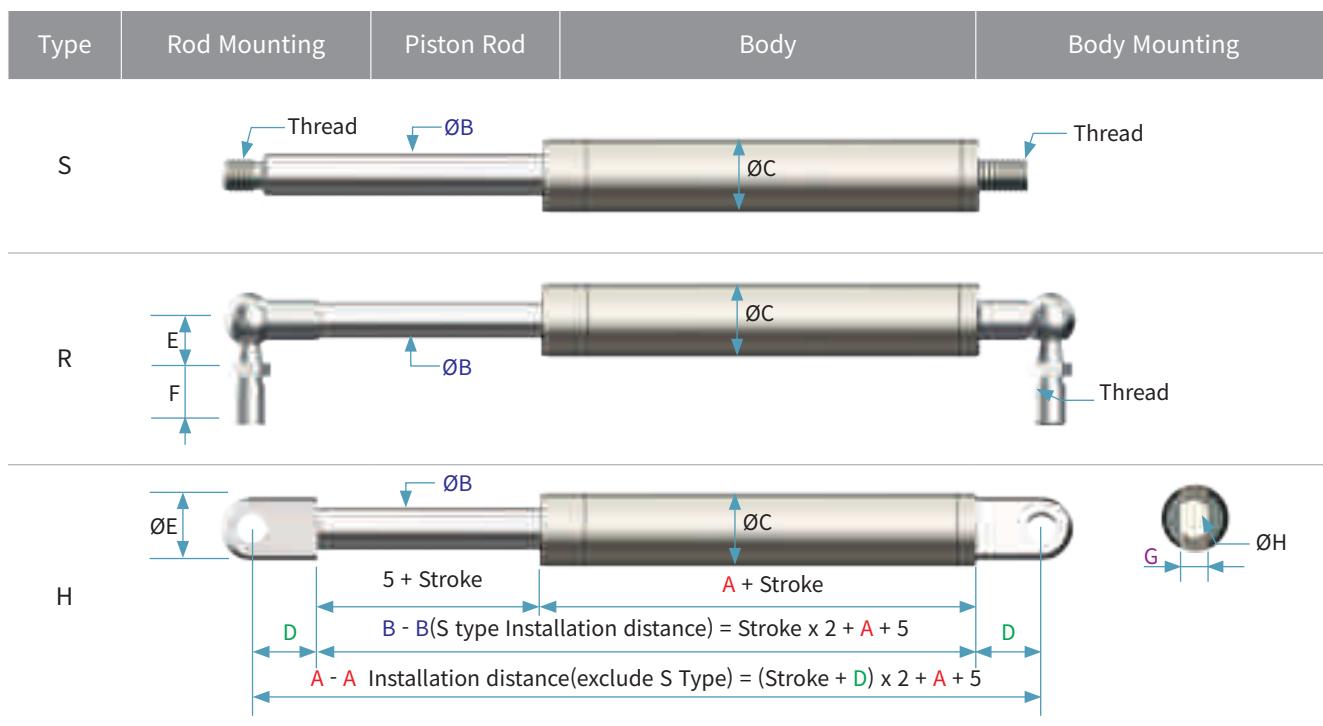

✓ Mechanical Machine Cover, Auxiliary Power Unit, Manhole Cover, Machinery, Medical Device, etc.

# KGL Series Free Lock Type

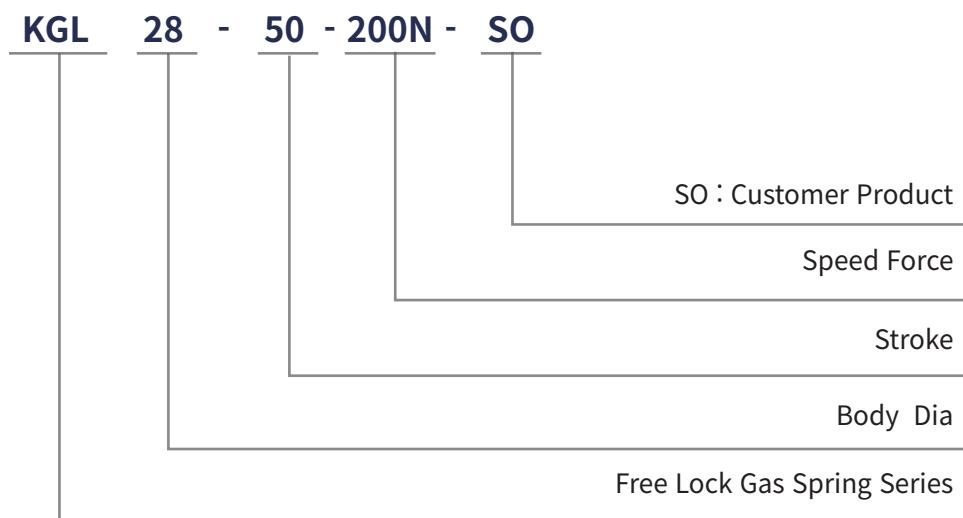

## Feature

- Free Lock Gas Spring series has all merits of general Gas Spring. KGL Series have a free lock function that operators can decide a stroke at wanted location where operators want to install. Order made is possible according to size, stroke, force, material, etc.
- Temperature ranges : Standard (-10~80°C), Special (-30~100°C)
- Order made is possible according to size, stroke, force, material, etc.

## Application

- ✓ It is used for a variety of purposes such as doors, auxiliary power device, chairs, medical equipment, and covers.

# Shock Absorber Instruction Manual & Safety Note

## // Instruction Manual & Safety Note

### 1. SHOCK ABSORBER

KOBA Shock Absorber has been developed for million cycles and assures long life cycles if customers keep below matters.

- 1) Ensure correct energy capacity before operation of shock absorber.
- 2) Do not weld or paint shock absorber's body.
- 3) Do not scratch or paint piston rod. (shock absorber can fail by oil leakage.)
- 4) Adjustment dial knob is preset to "0" when released from factory. Once achieved the correct damping strength, lock the screw.
- 5) Shock absorber shall be kept away from fire because it can be ignited.
- 6) Always check strength of installation site before using and it is recommended to install shock absorber at strong base structure. Secure the strength as "max. shock energy x safety ratio(2.5)"

- 7) Refer to below table of proper lock nut installation tightening torque. Tightening with excessive force may cause malfunction or damage to product.

Shock Absorber Installation Torque.

Thread (mm)	M8x1.0	M10x1.0	M12x1.0	M14x1.0	M16x1.5	M20x1.5	M25x1.5	M27x1.5	M27x2.0	M30x1.5	M36x1.5	M42x1.5
Nut Torque (Nm)	3.9	7.8	7.8	9.8	14.7	29.4	49	58.8	78.4	98	392	

# Applying anti-loosening adhesives is more efficient.

- 8) Be careful when using a snap ring structure shock absorber. In case of overloading the specification that mentioned on catalog, Snap ring and inner subparts can be swiftly extracted because inner pressure of shock absorber's Inner tube can be abnormally risen. Follow the designated specification and don't close your face to Snap ring type of shock absorber.
- 9) Don't carelessly dispose of oil in side of shock absorber for the environment and dispose according to waste control act.

# Shock Absorber Instruction Manual & Safety Note

## // Instruction Manual & Safety Note

- 10) Be careful of eccentric load and eccentric angle. If the impact load is over  $\theta=1^\circ$  of declination, Piston Rod can't be properly returned by bending deformation, and performance decline can occurred because of uneven wear of sliding parts, and machine damage can be occurred. Impact should be in center line of Piston Load (below  $\theta=1^\circ$ ).

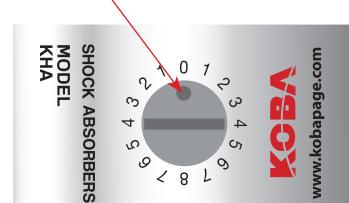

- 11) Check the operating temperature (-10~80°C) to get best performance. If you use it out of standard temperature range, the life expectancy of Seal and Accumulator can be decreased and it can be broken.  
(If you need to use shock absorber in special temperature, please contact us.)
- 12) If you use it on the circumstance of outer pressure like vacuum status, etc. instrument breakage can be occurred. Don't use it where cutting debris, cutting oil, moisture, etc is attached to Piston Rod, which cause malfunction, instrument breakage.  
(If you want to use it on these circumstances, please contact us.)
- 13) Adjustable type of shock absorber is designed to get suitable resistance force according to impact velocity by controlling the orifice area. Refer to below adjustment dial of KMA, KSA, and KHA Series.

The figure below shows the typical adjustment dials of KMA, KSA and KHA series.

After completing the adjustment, be sure to fix the adjustment dial with the setting fixing bolt.

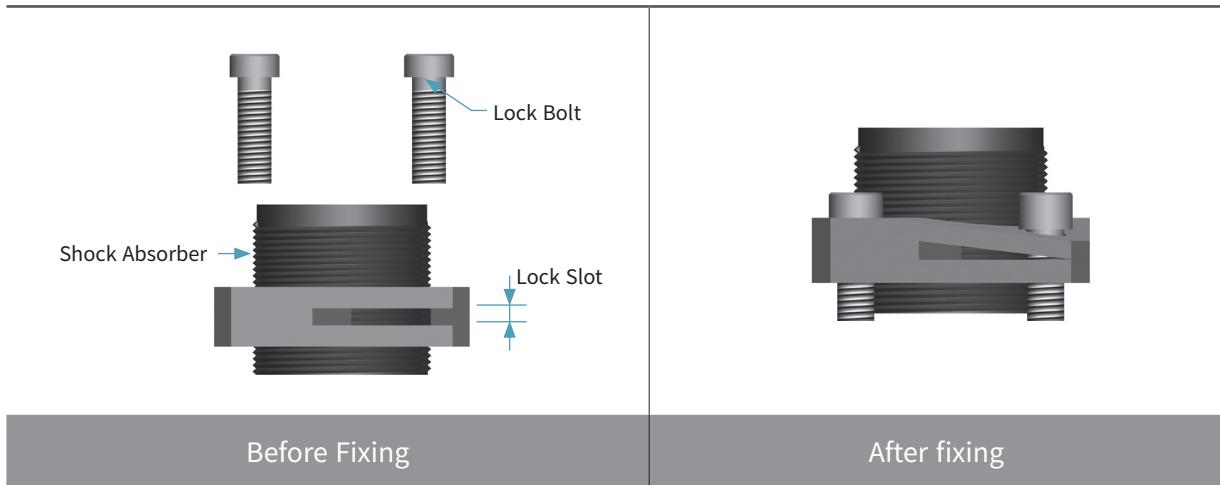

### KMA & KSA & KHA Series Adjustment Dial

KMA Series	KSA Series	KHA Series
 Set screw bolt	 Set screw bolt	 Set screw bolt

# Applying anti-loosening adhesives is more efficient.

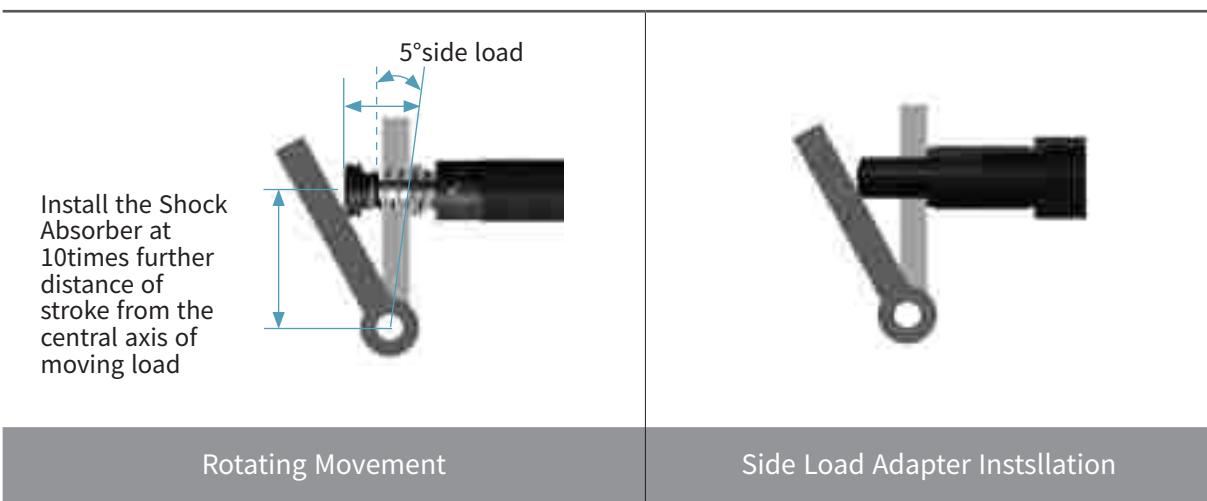

#### 14) How to mount the Flange

After holding the flange in fixing position, tighten the Lock Bolt, and then pressure is applied to the Lock Slot to fix the position correctly. If you want to remove the shock absorber and Flange, loosen the bolt only.

#### 15) Precaution in case of rotation moving

As shown in the figure, Rotation location from shock absorber's center shall be ten times of stroke length. If the distance is short, the life span of absorber can be shortened by uneven load. In particular, do not use Urethane Cap in rotary motion. If the center distance of the shock absorber is to be inevitably shortened, use the uneven wear adapter.

## 2. General Checking

### 1) Regular Checking

- ① Check the below things regularly.

Because disassemble repair of shock absorber is not possible, in case of malfunction change it as new one. Don't carelessly dispose of oil in side of shock absorber for the environment and dispose according to Waste Control Act.

# Shock Absorber Instruction Manual & Safety Note

## // Instruction Manual & Safety Note

### 2) Checking Point

- Lock Nut fastening condition
- Condition of Piston Rod (Damage or Scratch)
- Checking the Stroke
- Outer Appearance of shock absorber
- Oil Leakage
- Noise on operation

If any trouble to be found, please refer the below “3) Trouble and Count measure”.

### 3) Trouble and Count measure

Trouble	Cause	Counter Measure
Lock nut is not fastened tightly	Lack of fixing torque	Fasten the nut or bolt tightly
	Vibration of machine	Check the vibration and adjust it
No suitable Shock Absorption	Applied energy is over the capacity	Change it with higher capacity one
	No suitable dial adaption	Set adjustment dial to “0”
	During Stroke transfer, the movement is stopped by stopper	Adjust the stopper location to use long stroke
	The shock absorber is not in center line	Install the shock absorber in center line
	Impact angle is over 1° from the center axis	
	Vibration on impact material	Install the guide to remove the vibration
	Body of shock absorber is used as Stopper	Install Stop Collar or Stopper
	Ambient temperature is high	Change it to heat-resisting type
	Oil Seal is damaged because of foreign material on the Piston Rod	Clean Piston Rod and cover the Piston Rod
	Moving material is shocked directly to shock absorber	Install Side Load Adaptor
Oil leakage	Life span is over	Change it a new one
	Oil Seal is damaged because of foreign material on the Piston Rod	Clean Piston Rod and cover the Piston Rod
	Ambient temperature is too low	Change it to cold-resisting type
Rod is not returned	Life span is over	Change it a new one
	The shock absorber is not in center line	Install the shock absorber in center line
	Impact angle is over 1° from the center axis	
	Vibration on impact material	Install the guide to remove the vibration
	Body of shock absorber is used as Stopper	Install Stop Collar or Stopper
	Ambient temperature is too low	Change it to cold-resisting type
	Life span is over	Change it a new one

\* If Shock absorber is installed inside of Chamber, please use after consulting with us.

KCBA  
BEST SHOCK ABSORBER

※ The specifications in catalog are subject to change without notice in order to improve performance.
